

# Amsterdam End to End Use Case Test Lab

Helen Chen

August 10 , 2017

- **The reasons for identifying ONE lab to implement each use case are resource and time constraint**
- **Integration team will work with lab owner and community together to implement it**
- **Timeframe, we need to finish it before release date**
- **We encourage all open labs to implement and deploy those use cases by themselves**
  - **For vCPE, since it uses exclusively open source VNFs or VNFs developed by ONAP community, you could duplicate easy.**
  - **For VoLTE, we are trying to get some licenses (it may be up to 3) for those commercial VNFs. Please let me know who are interest in it.**
  - **And you could modify those use cases**

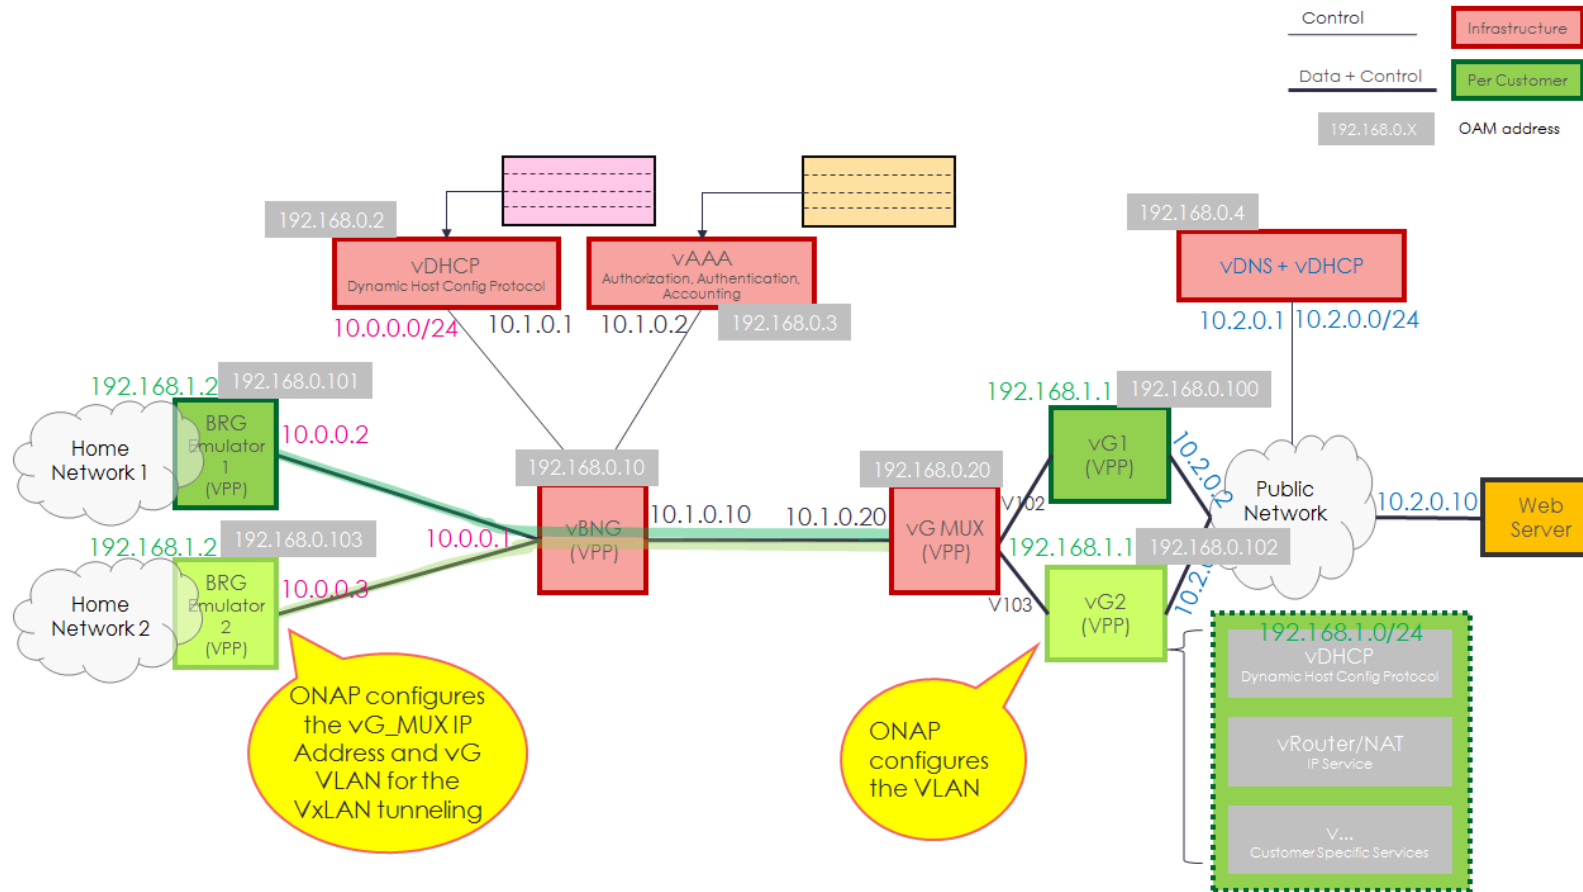

# VoLTE Use Case

## Highlights

- ❑ Commercial VFs and PFs are orchestrated
- ❑ Multi data centers deployment
- ❑ Data centers are interconnected by overlay and underlay networks across WAN
- ❑ Not include APPC

# vCPE Use Case

## Highlights

- ❑ VNFs are either from Opensource or developed in ONAP community.
- ❑ No physical device, it could be very easy duplicated in other labs

# Suggested Criteria

- Lab has desire to do implement it
- Satisfy minimum asset requirements
- One local lab owner is required and one network/system engineer is required to polish the test case.
- Self-motivation and collaboration is past one month with the Integration team

# The current candidate Labs, collected before last Friday

- VoLTE Use case: China Mobile, China Telecom
- vCPE Use case: Intel Lab, China Telecom
