

# E2E Network Slicing Use Case Requirements for R11

Requirements Subcommittee Review

**Participants:** STL, Wipro, China Telecom, TIM, Huawei, Tech Mahindra, Amdocs, CMCC, AT&T

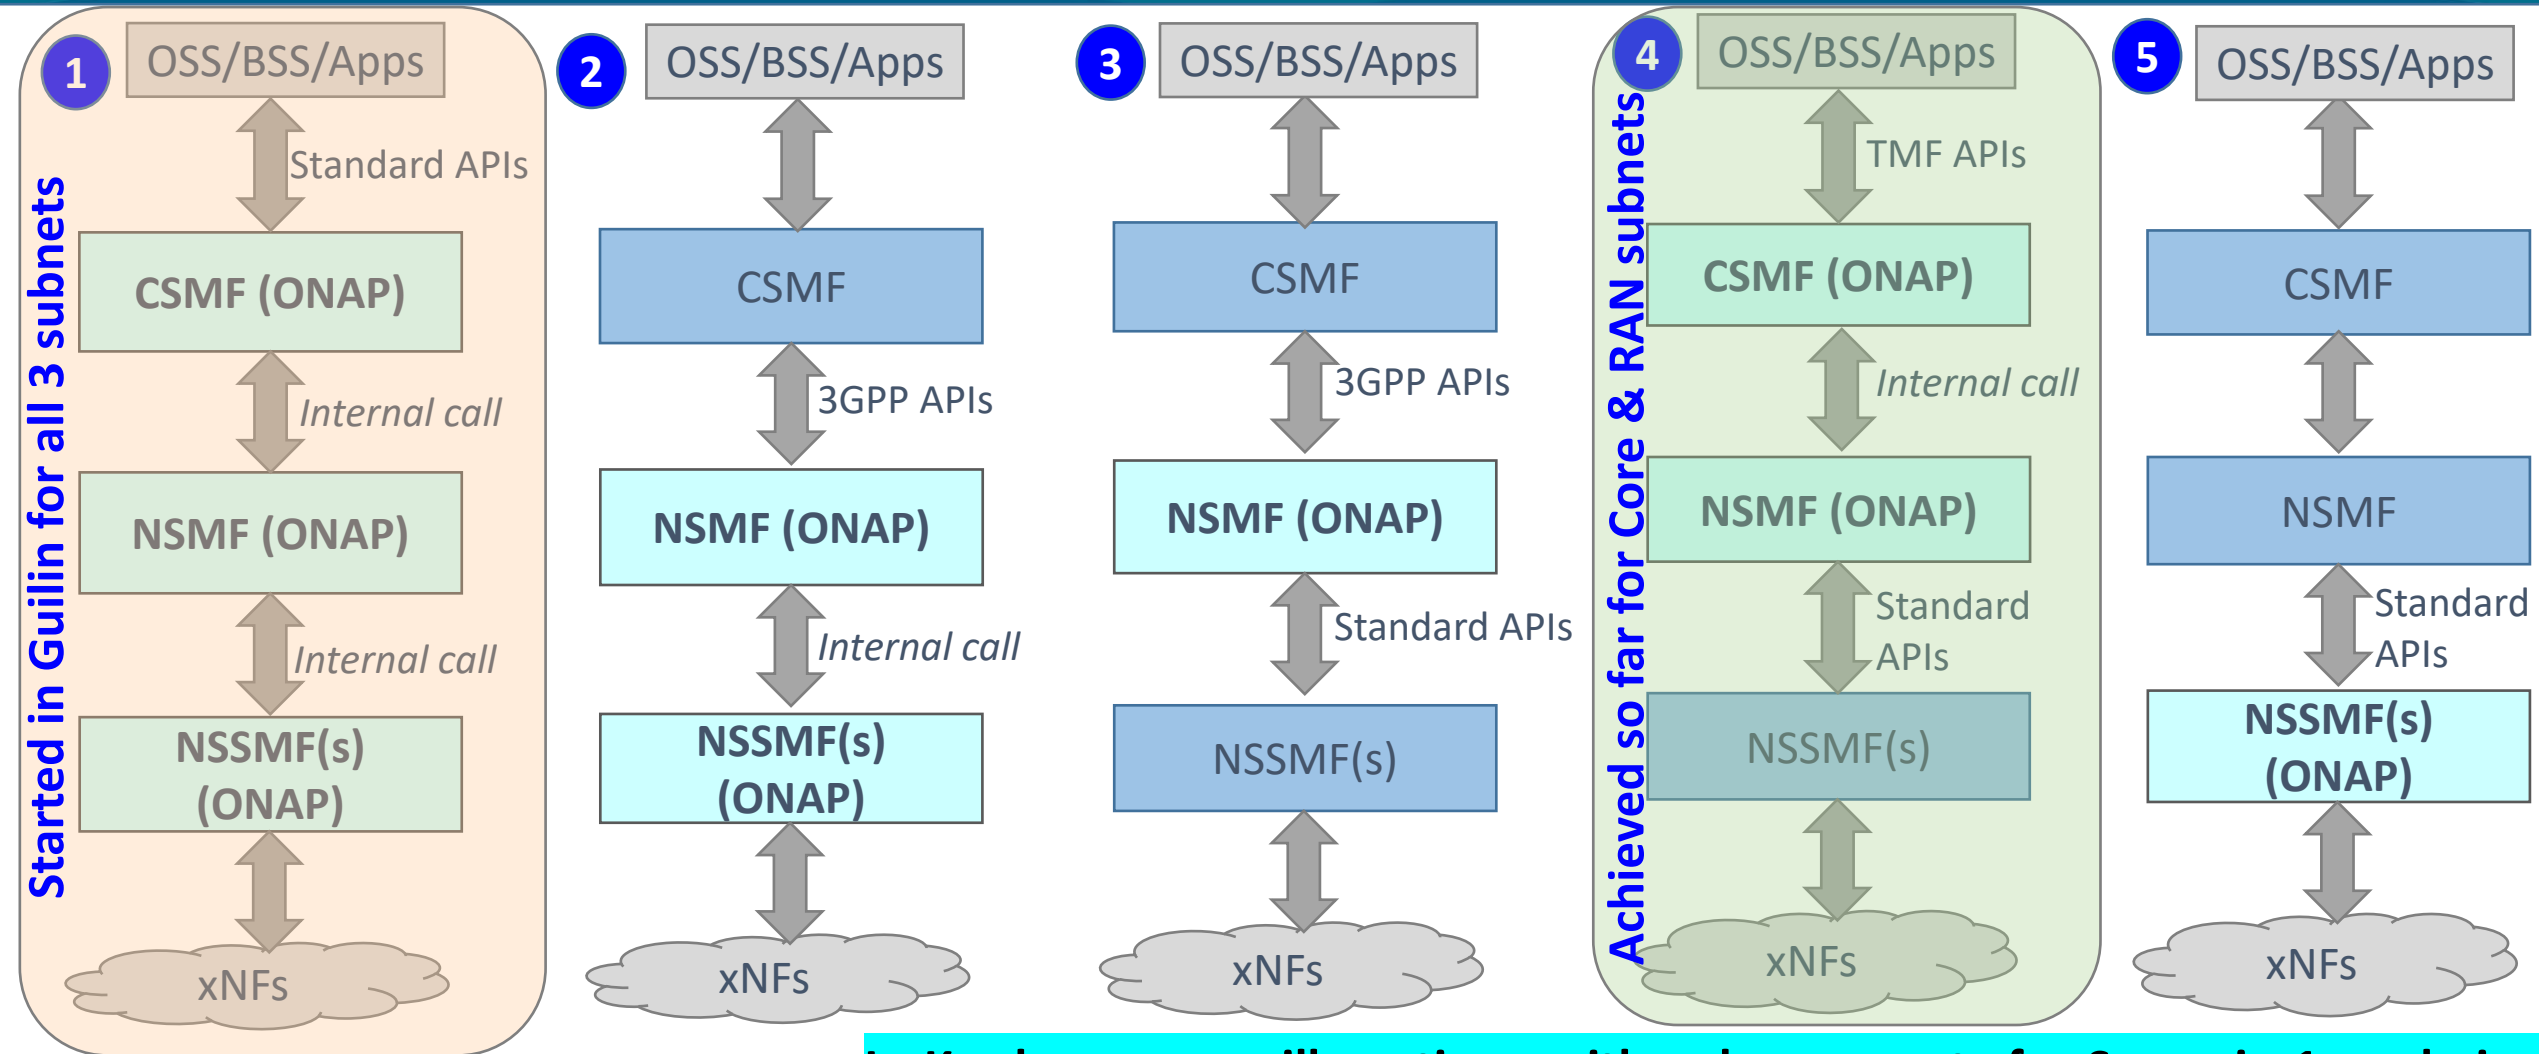

**Authors:** Kevin Tang (STL), Ahila P (Wipro), Dong Wang (China Telecom),  
Henry Yu (Huawei), N.K. Shankar (STL), Borislav Gluzman (Amdocs)

Reporters: Kevin Tang (STL) and Ahila P (Wipro)

# Contents

1. **ONAP-based Slice Management Overall Architecture and Choices**
2. **ONAP-based Slice Management NSI Life-cycle View**
3. **Kohn Release Requirements and Impacts**
4. **Summary of Kohn Release API Impacts**

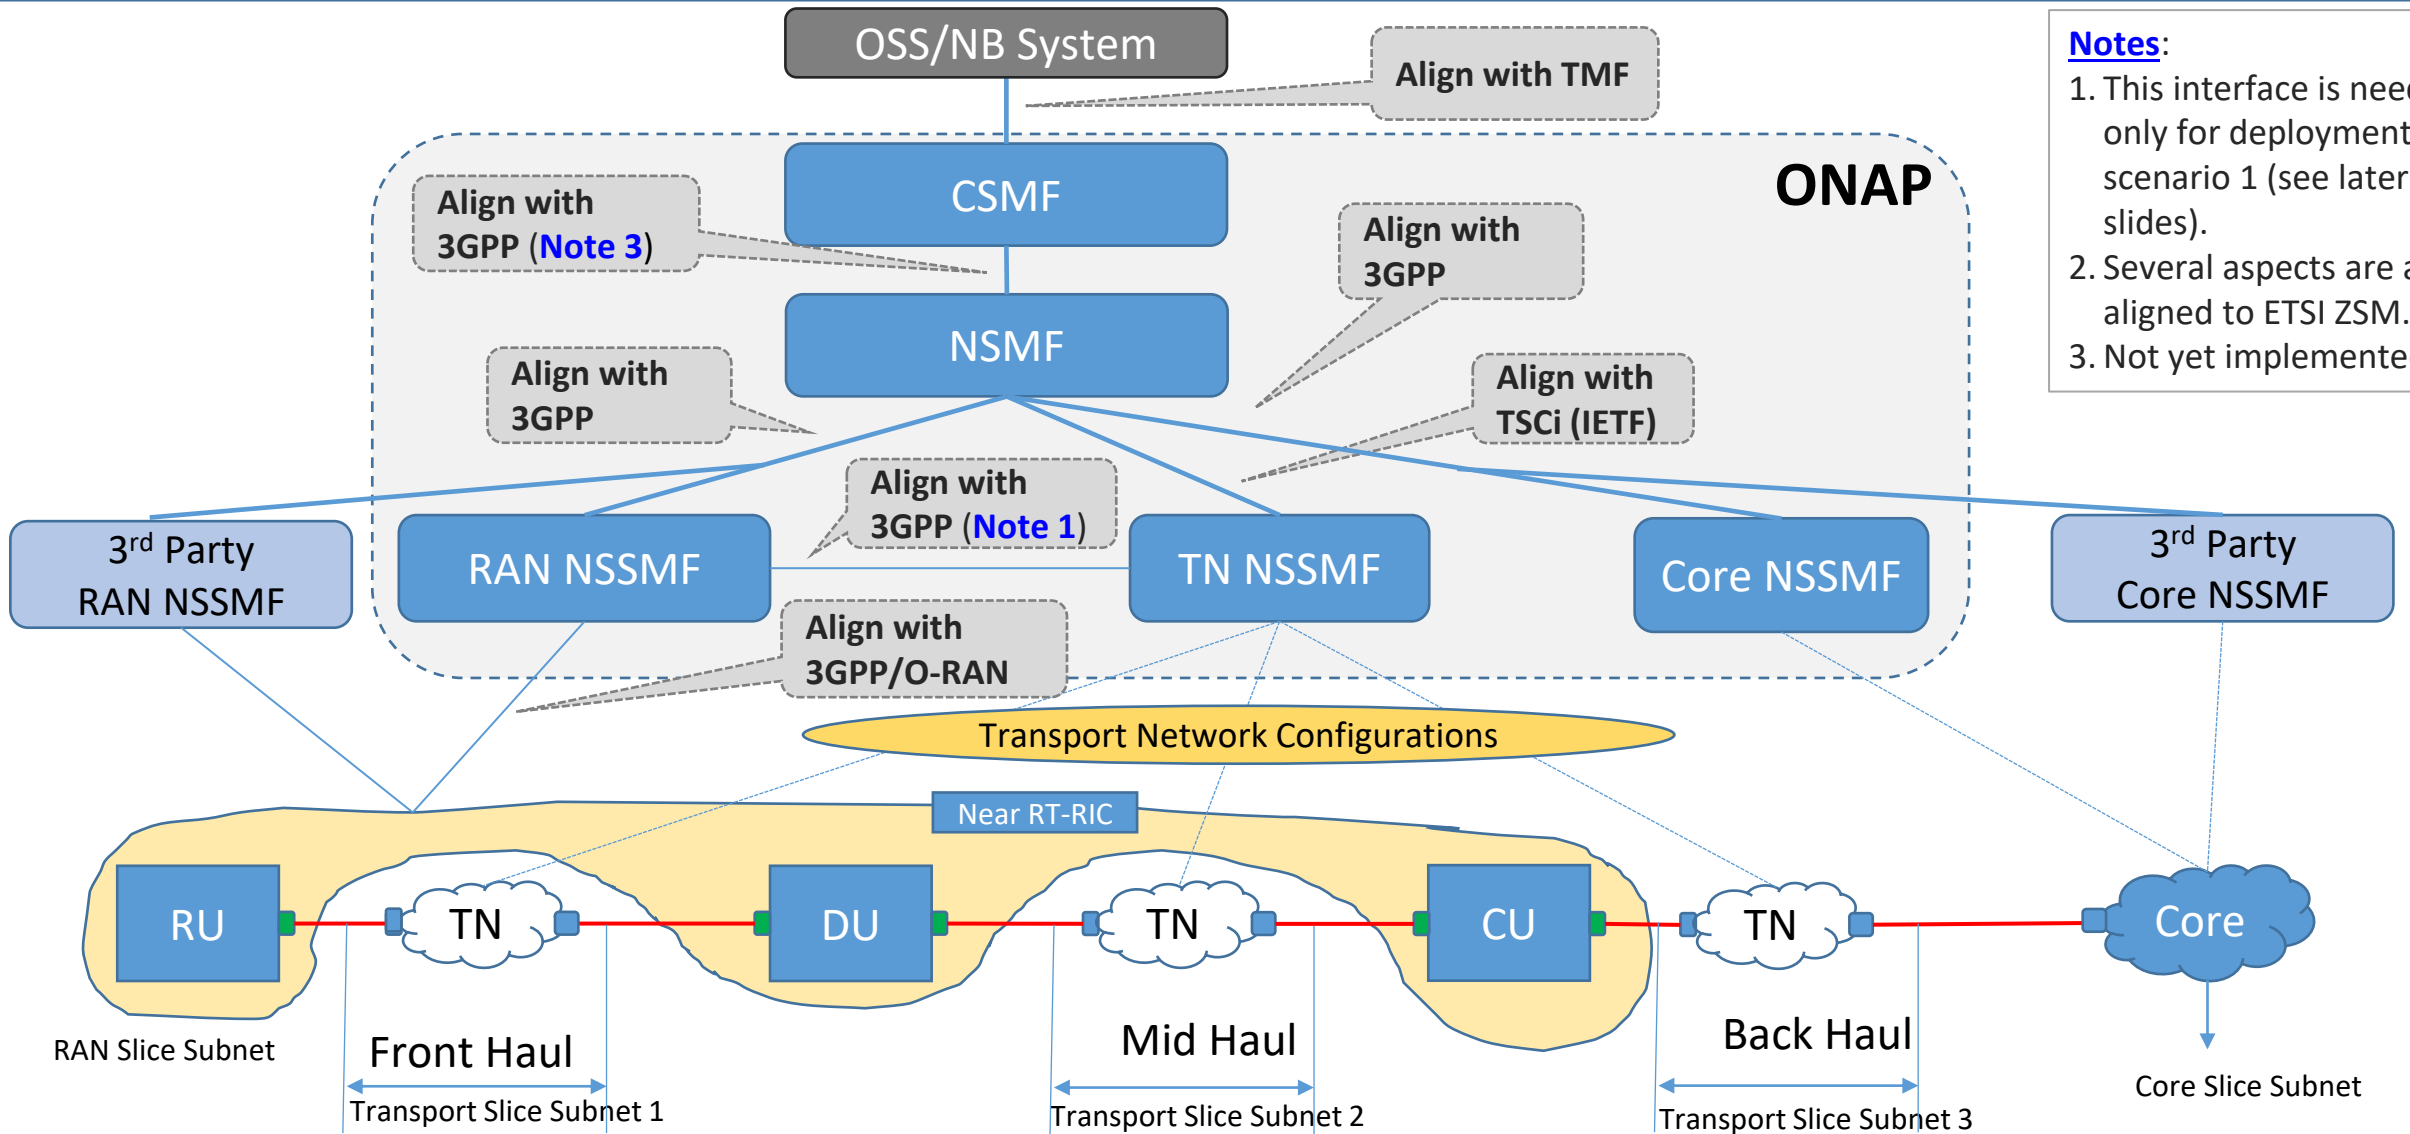

# ONAP-based Slice Management Overall Architecture Choices

3<sup>rd</sup> party component

In K-release, we will continue with enhancements for Scenario 1, and aim to stabilize the existing functionality for different scenarios.

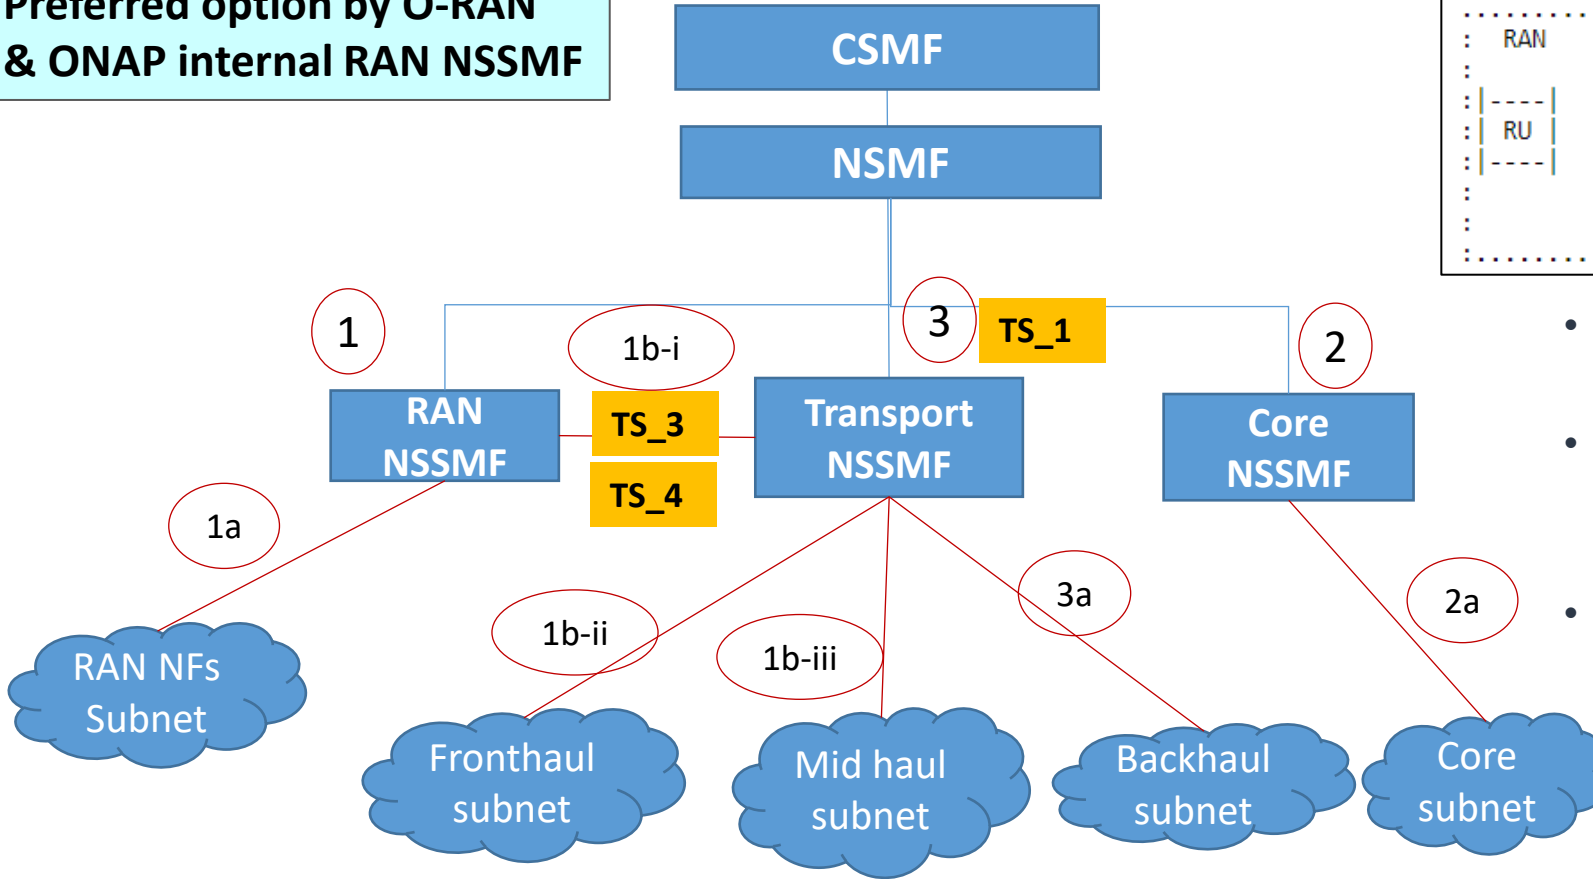

# E2E Network Slicing: Architecture & Interfaces

- Notes:**
1. This interface is needed only for deployment scenario 1 (see later slides).
  2. Several aspects are also aligned to ETSI ZSM.
  3. Not yet implemented

# RAN & Transport Subnet: Interaction Scenario 1

Preferred option by O-RAN & ONAP internal RAN NSSMF

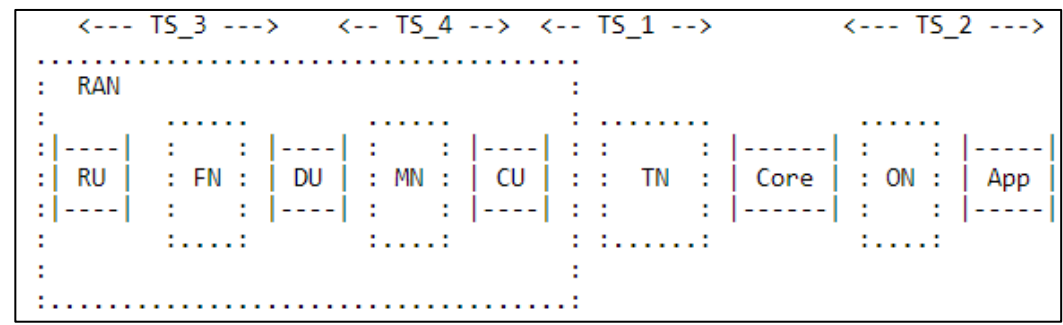

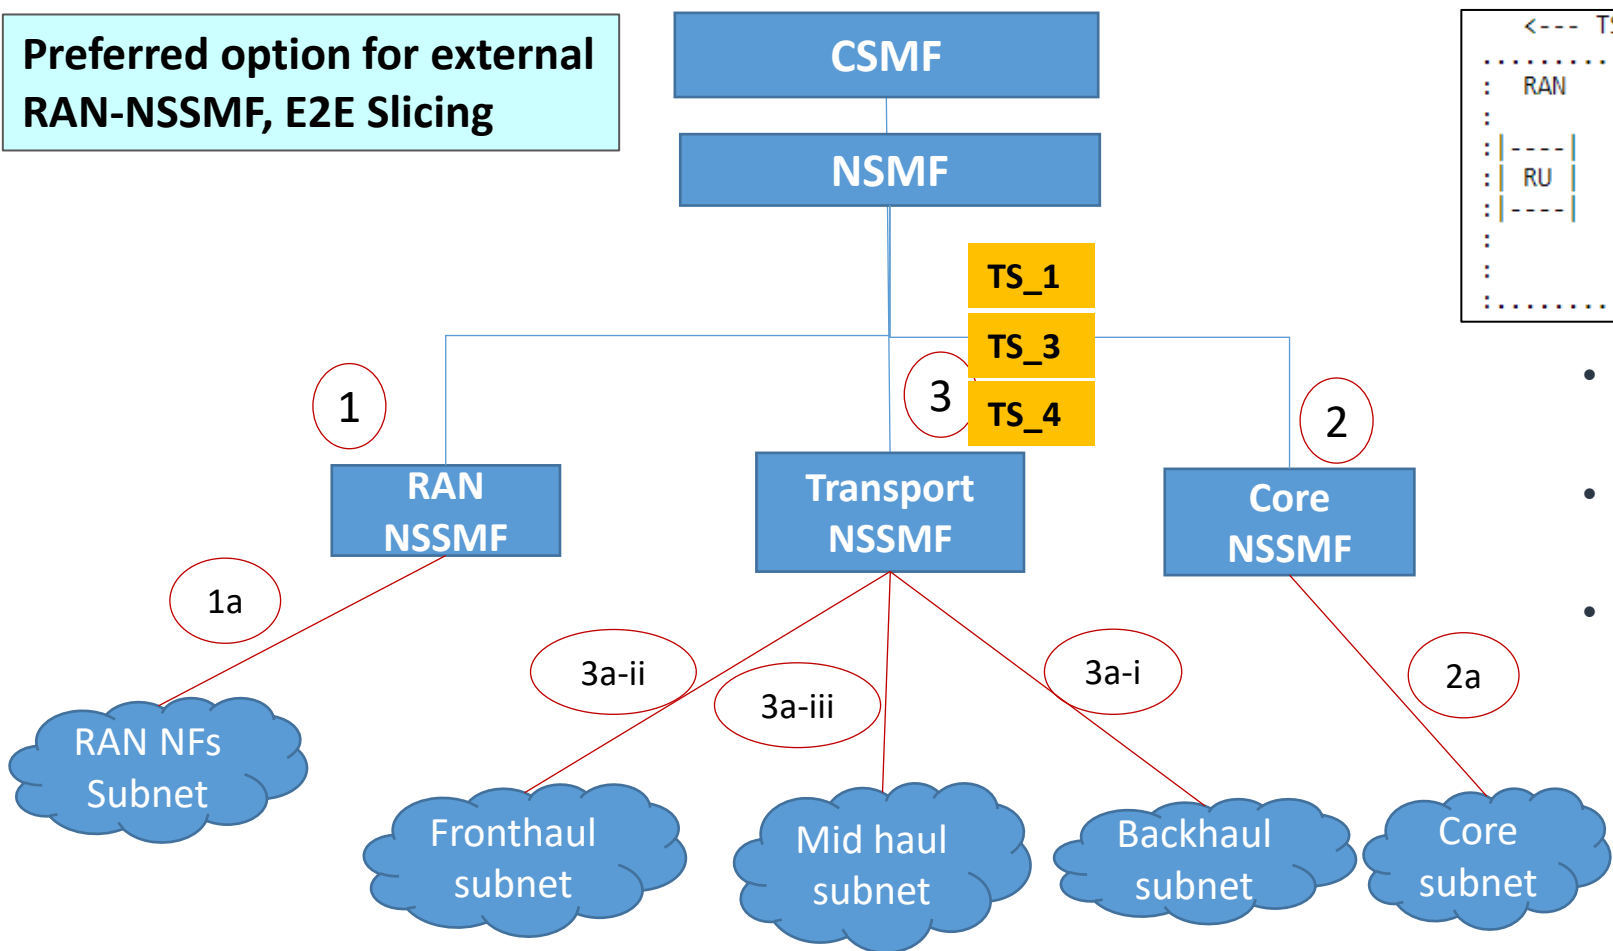

- TS\_1 is backhaul transport slice; TS\_3, fronthaul; TS\_4, midhaul.
- TN MD (T-NSSMF) receives TS\_1 from NSMF (step 3), and TS\_3 and TS\_4 from RAN NSSMF (step 1b-i).
- TN MD then configures backhaul (3a), fronthaul (1b-ii), and midhaul (1b-iii), respectively.

Done in J release and Enhancements to be done in K release

- **RAN NSSMF** shall be responsible for determination of Slice Profile of **FH, MH and RAN NFs**.
- **RAN NSSMF** shall be responsible for entire **RAN subnet comprising FH and MH** (stitching together, CL actions, etc.)

# RAN & Transport Subnet: Interaction Scenario 2

Preferred option for external RAN-NSSMF, E2E Slicing

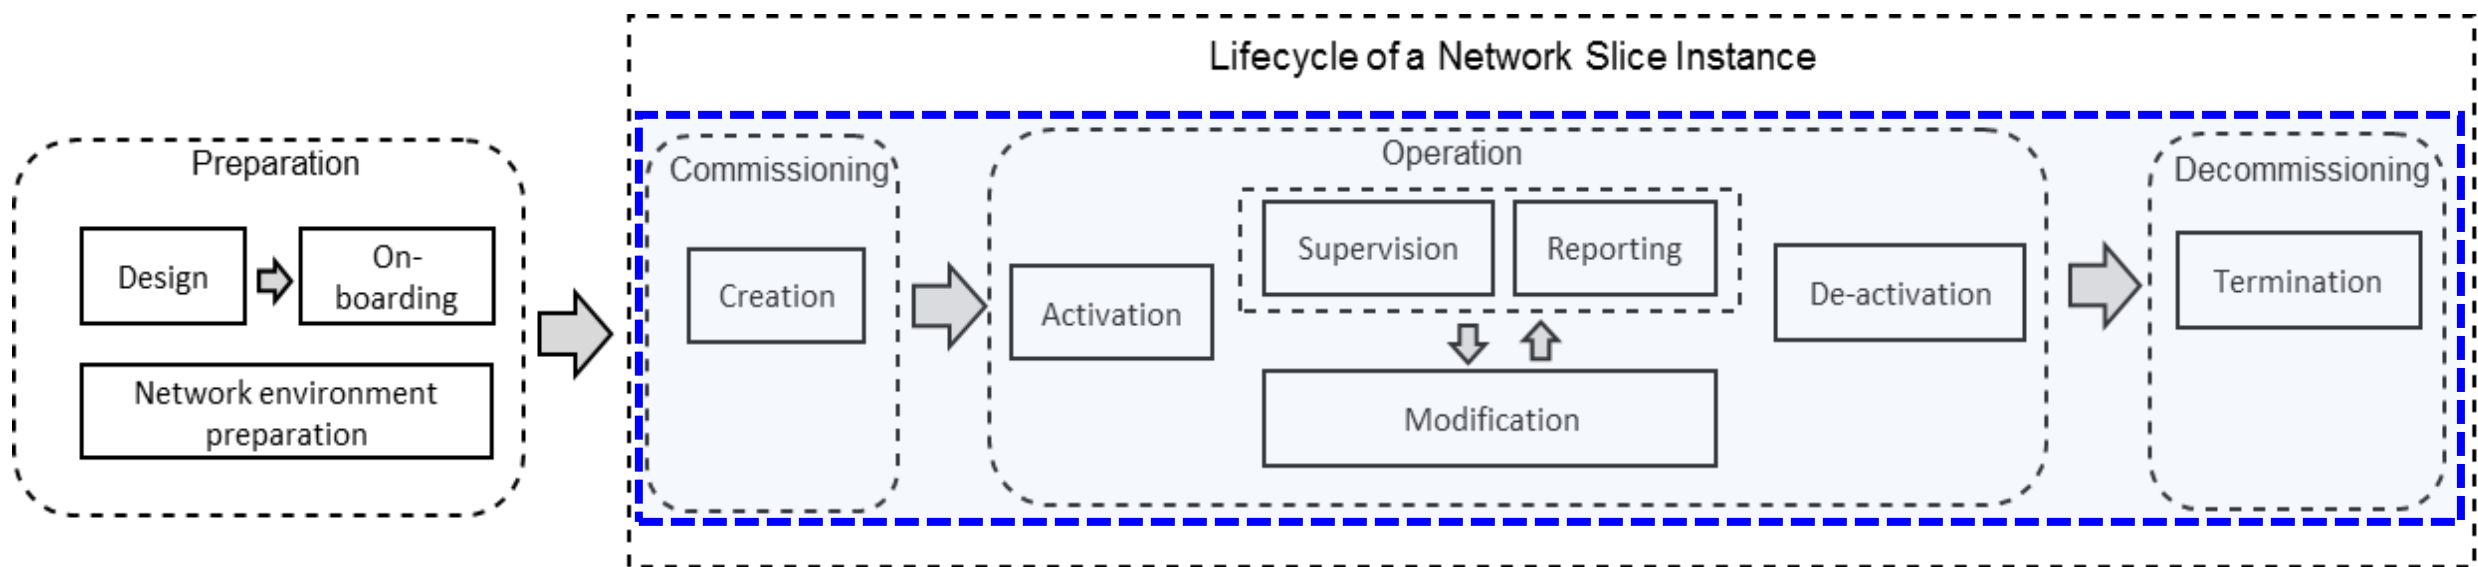

- TS\_1 is backhaul transport slice; TS\_3, fronthaul; TS\_4, midhaul.
- TN MD (T-NSSMF) receives TS\_1, TS\_3 and TS\_4 from NSMF (step 3).
- TN MD then configures backhaul (3a-i), fronthaul (3a-ii), and midhaul (3a-iii), respectively.

Activation, deactivation & termination testing completion in K release

- **NSMF** shall be responsible for determination of Slice Profile of **FH, MH and RAN NFs**.
- **NSMF** shall be responsible for stitching together **e2e slice including FH and MH**.

# ONAP-based Slice Management - NSI Life Cycle View

**Objective:** Demonstrate e2e slice design instantiation and operation, including RAN, core and transport slice sub-nets

Ref.: 3GPP TS 28.530

 Focus area for minor enhancements in Kohn

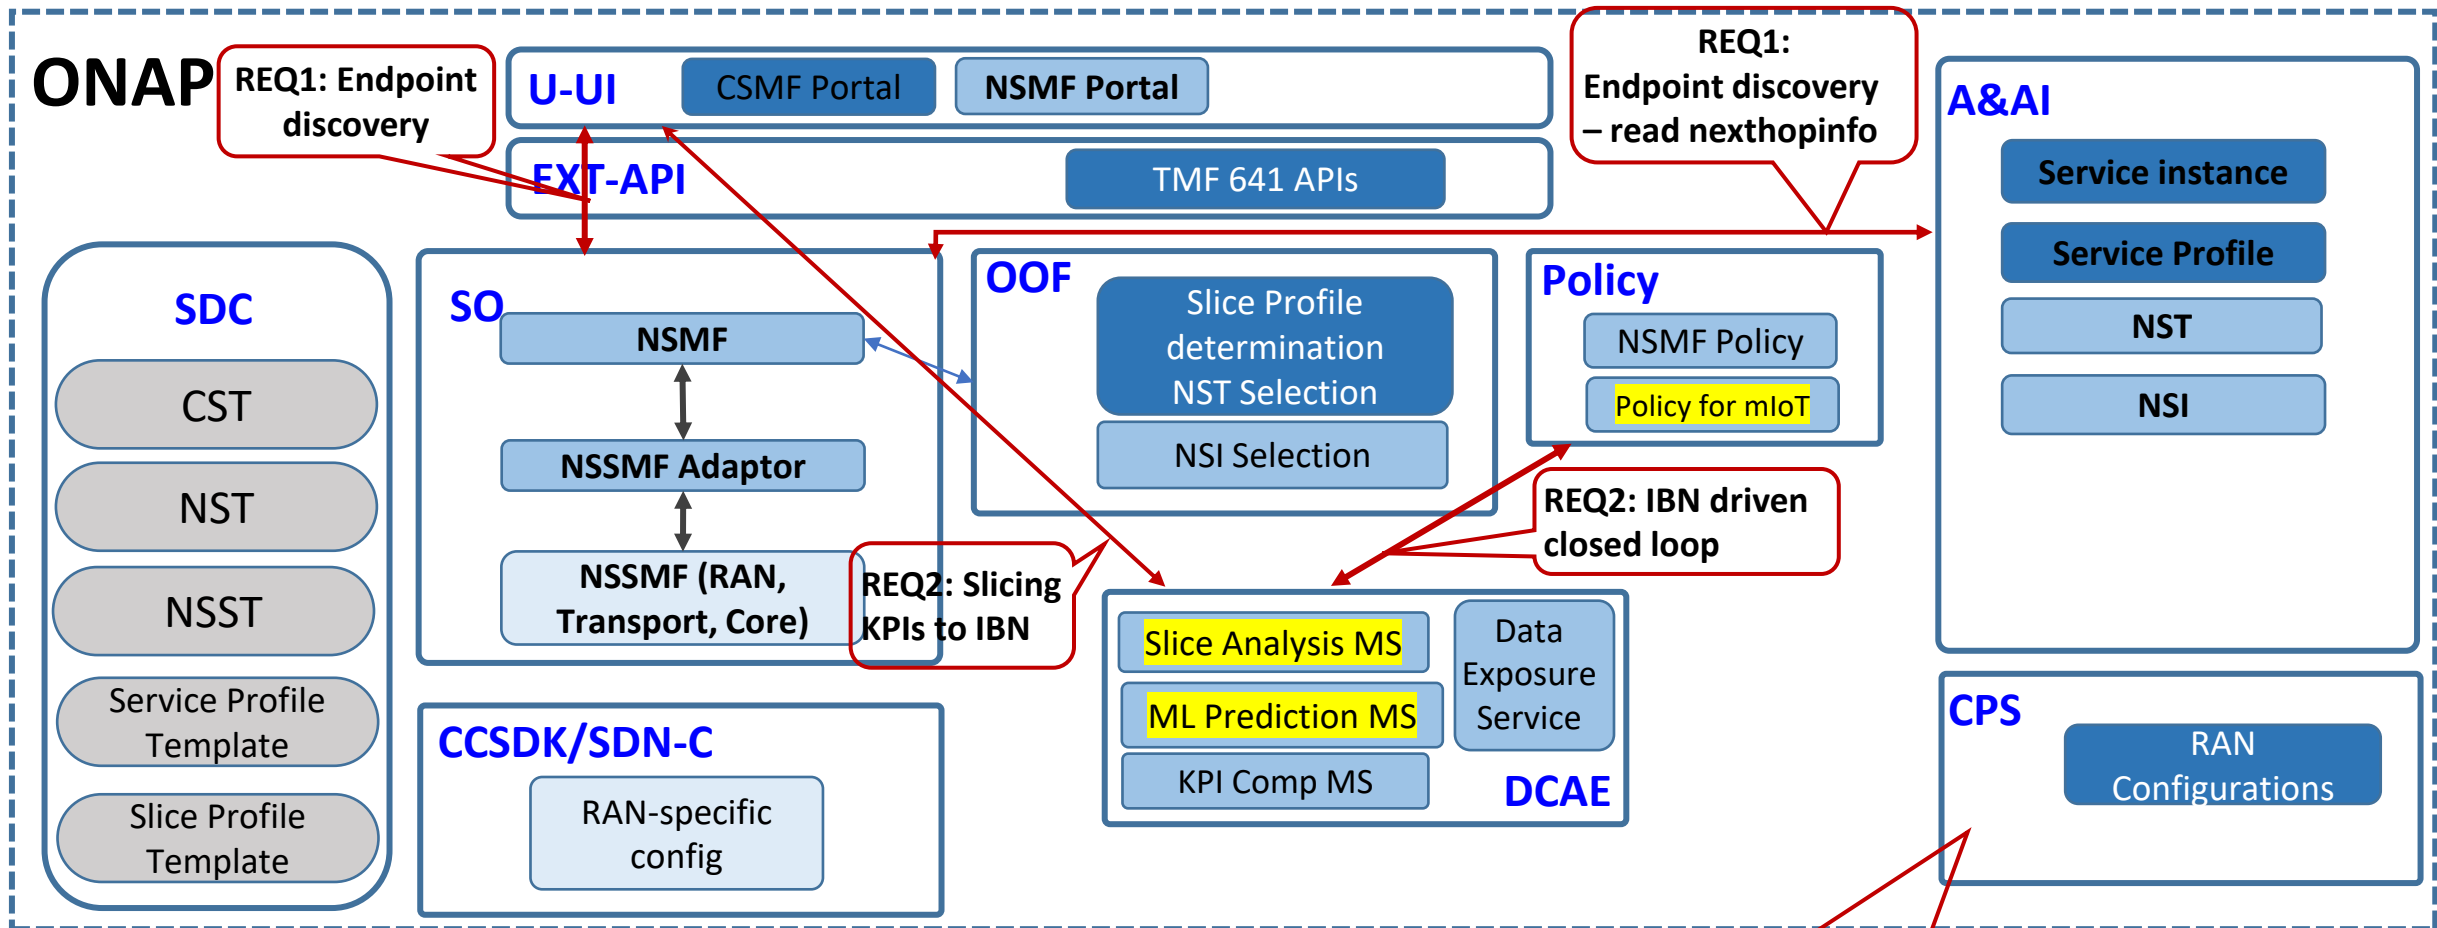

- **Design and pre-provision:** Creation of necessary slice/slice sub-net templates.
- **Instantiation/Configuration & Activation/Deactivation** of NSIs, including instantiation/mapping of its constituent slice sub-nets (RAN, Core and Transport).

# E2E Network Slicing: Proposed Requirements for Kohn

- **REQ-1: Dynamic discovery of Core and RAN endpoints at NSMF (carry-over)**
  - Carry-over requirement from Jakarta release.
  - NSMF discovers the Core and RAN endpoints for back haul dynamically at the time of slice allocation/reuse
  - RAN, Core endpoint of back haul is considered for Kohn release
  - Front haul and mid haul end points discovery is a stretch goal
- **REQ-2: IBN driven E2E Network Slicing (new, joint with IBN)**
  - Leverage ML prediction MS done in Jakarta release as a PoC
  - Focus on RAN subnet slicing only
  - Integration of ML prediction MS with DCAE (IBN and NS teams)
  - Enhancement to intent creation and workflow to support E2E Network Slicing based on UII, AAI and DCAE (IBN team)
  - Enhancement to the closed-loop and the ML/Slice analysis MS for slicing KPI monitoring to support IBN (NS team)
- **REQ-3: mIoT slice support (New)**
  - Support Slice creation, activation, deactivation and termination for mIoT applications
- **REQ-4: Use case test automation (carry-over)**
  - Carry out test automation for slicing use case in phases
  - Target to accomplish test automation for manual configurations

# E2E Network Slicing: Impact Overview

↔ New interface    ↔ Enhanced interface

\* Other relevant impacts are covered by IBN use case

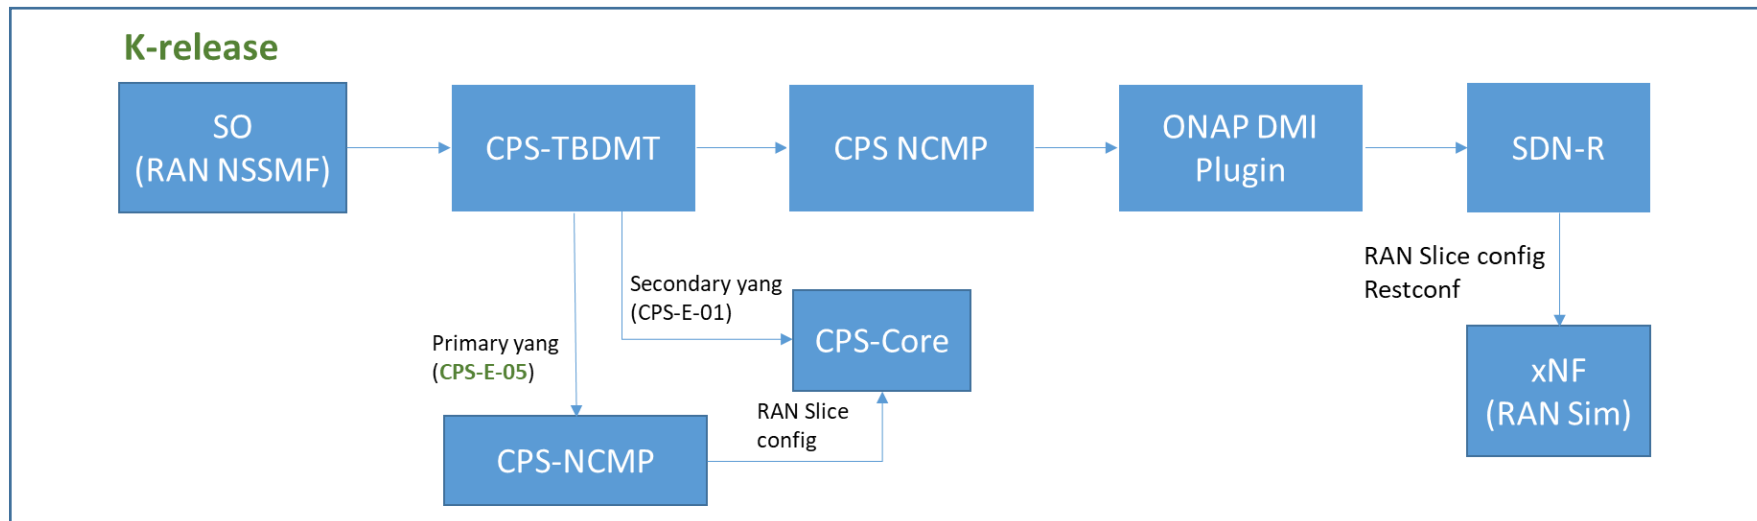

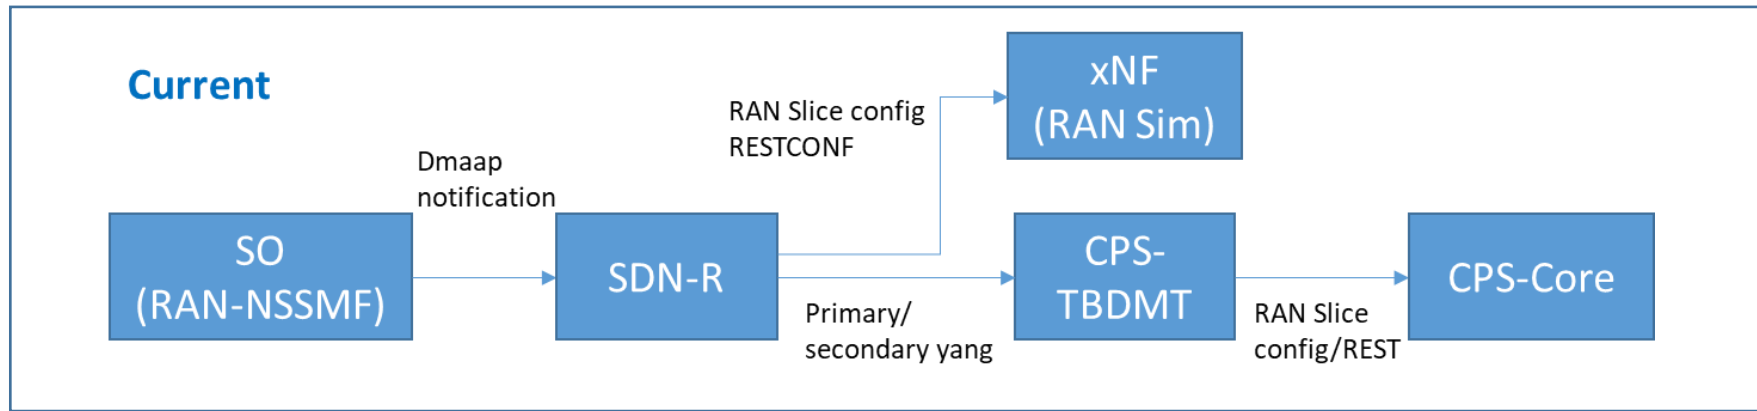

Impacts in Kohn

REQ4: CPS-TBDMT to be deployed by OOM as part of CPS

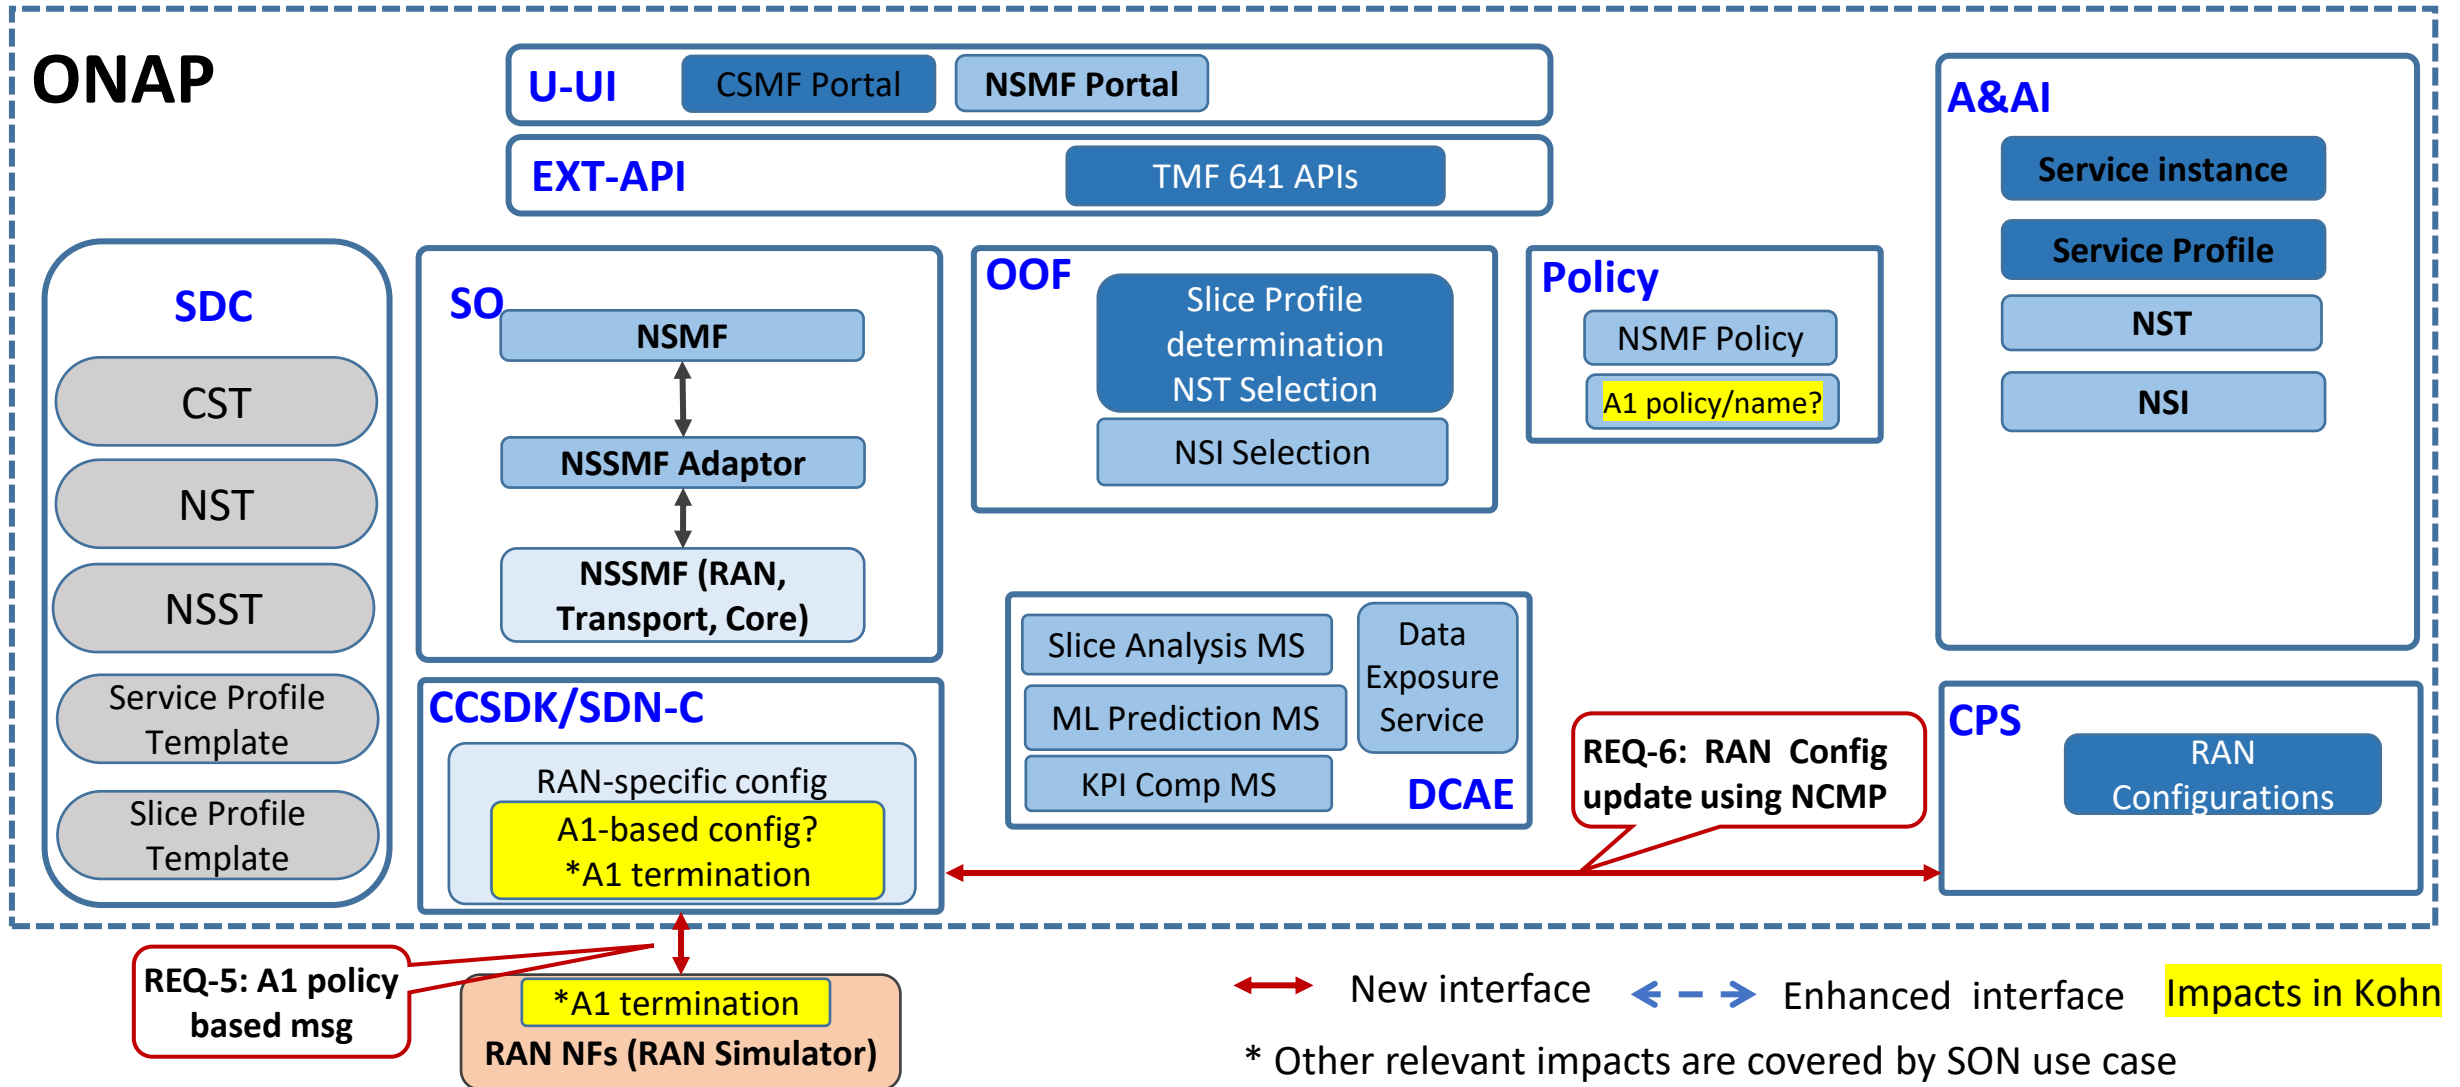

# RAN Slicing: Proposed Requirements for Kohn

- **REQ-5: RAN-Configuration over A1 enhancements (new) (Stretch goal)**
  - Sending AI/ML based config updates to Near-RT RIC over A1 from closed loop (throughput guidance or maxNumberOfConns)
  - Alignment with O-RAN A1 specification and information models
  - Work with SON use case to leverage A1 termination work in SDN-R and RAN Simulator (TBD)
- **REQ-6: CPS-TBDMT enhancement to integrate with NCMP (Carry-over) (Stretch goal)**
  - For RAN Slice configuration, CPS Core is invoked directly from TBDMT.
  - Support for CPS-E-05 interface requires Cache to be enabled
  - Support RAN configuration update using NCMP to SND-R
    - RAN slicing requires multiple manipulations while CPS can only do the xNF updates but cannot provide placeholder for other manipulations.
    - SO (RAN NSSMF) cannot invoke CPS for every xNF read/write operations that each RAN slice operation involves
    - More investigation needed with CPS project on the support for the CPS impacts or potential new solutions.
- **REQ-7: CSIT for RAN Slicing**

# CPS-TBDMT Enhancement to Integrate with NCMP

# RAN Slicing: Impact Overview

# TN Sub-net Slicing: Proposed Requirements for Kohn

- **REQ-8:** TN NSSMF enhancements according to IETF latest specification (Carry-over) (Covered by CCVPN use case)
- **REQ-9:** Transport Slicing enhancement to support IBN based TN slicing (Carry-over) (Covered by CCVPN use case)
- **REQ-10:** CSIT for TN slicing (Carry-over) (Covered by CCVPN use case)

# Carry-over requirements from Jakarta Release

- **REQ-11: DCAE Non-functional requirements (Carry-over)**
  - DCAEGEN2-2907: REQ-358 No root (superuser) access to database from application container
  - DCAEGEN2-2801: Enhancements to KPI Computation MS (partial)
- **REQ-12: Fix to Core Slicing issues (Carry-over) (could also be put to the Jakarta maintenance release)**
  - <https://jira.onap.org/browse/SO-3810>
  - <https://jira.onap.org/browse/SO-3835>
  - <https://jira.onap.org/browse/SO-3838>
- **REQ-13: Carry-over integration tests from Jakarta**
  - Depending on the progress of the testing in Jakarta release

# API impact summary

Interacting components	API impact?	Remarks
ExtAPI -> Northbound	No	
UUI -> SO	Yes	Dynamic endpoints discovery at NSMF
SO -> OOF	No	
OOF -> CPS	No	
SO (NSMF) -> SO (NSSMF)	Yes	Dynamic endpoints discovery at NSMF
SO (NSSMF Adapter) -> SO (External RAN NSSMF)	No	
SO -> SDN-C/SDN-R	No	
SDN-R -> RAN Simulator	Yes	A1 interface for RAN policy/configuration
Any component / SO -> AAI	Yes	SO invokes AAI to read the nexthopinfo
DCAE Slice Analysis MS -> CPS	No	
CPS -> CCSDK/SDN-C	Yes	Use CPS as an abstract layer to update xNF
UUI -> DCAE	Yes	Slicing KPIs monitoring
AAI -> DCAE	Yes	For IBN driven closed loop

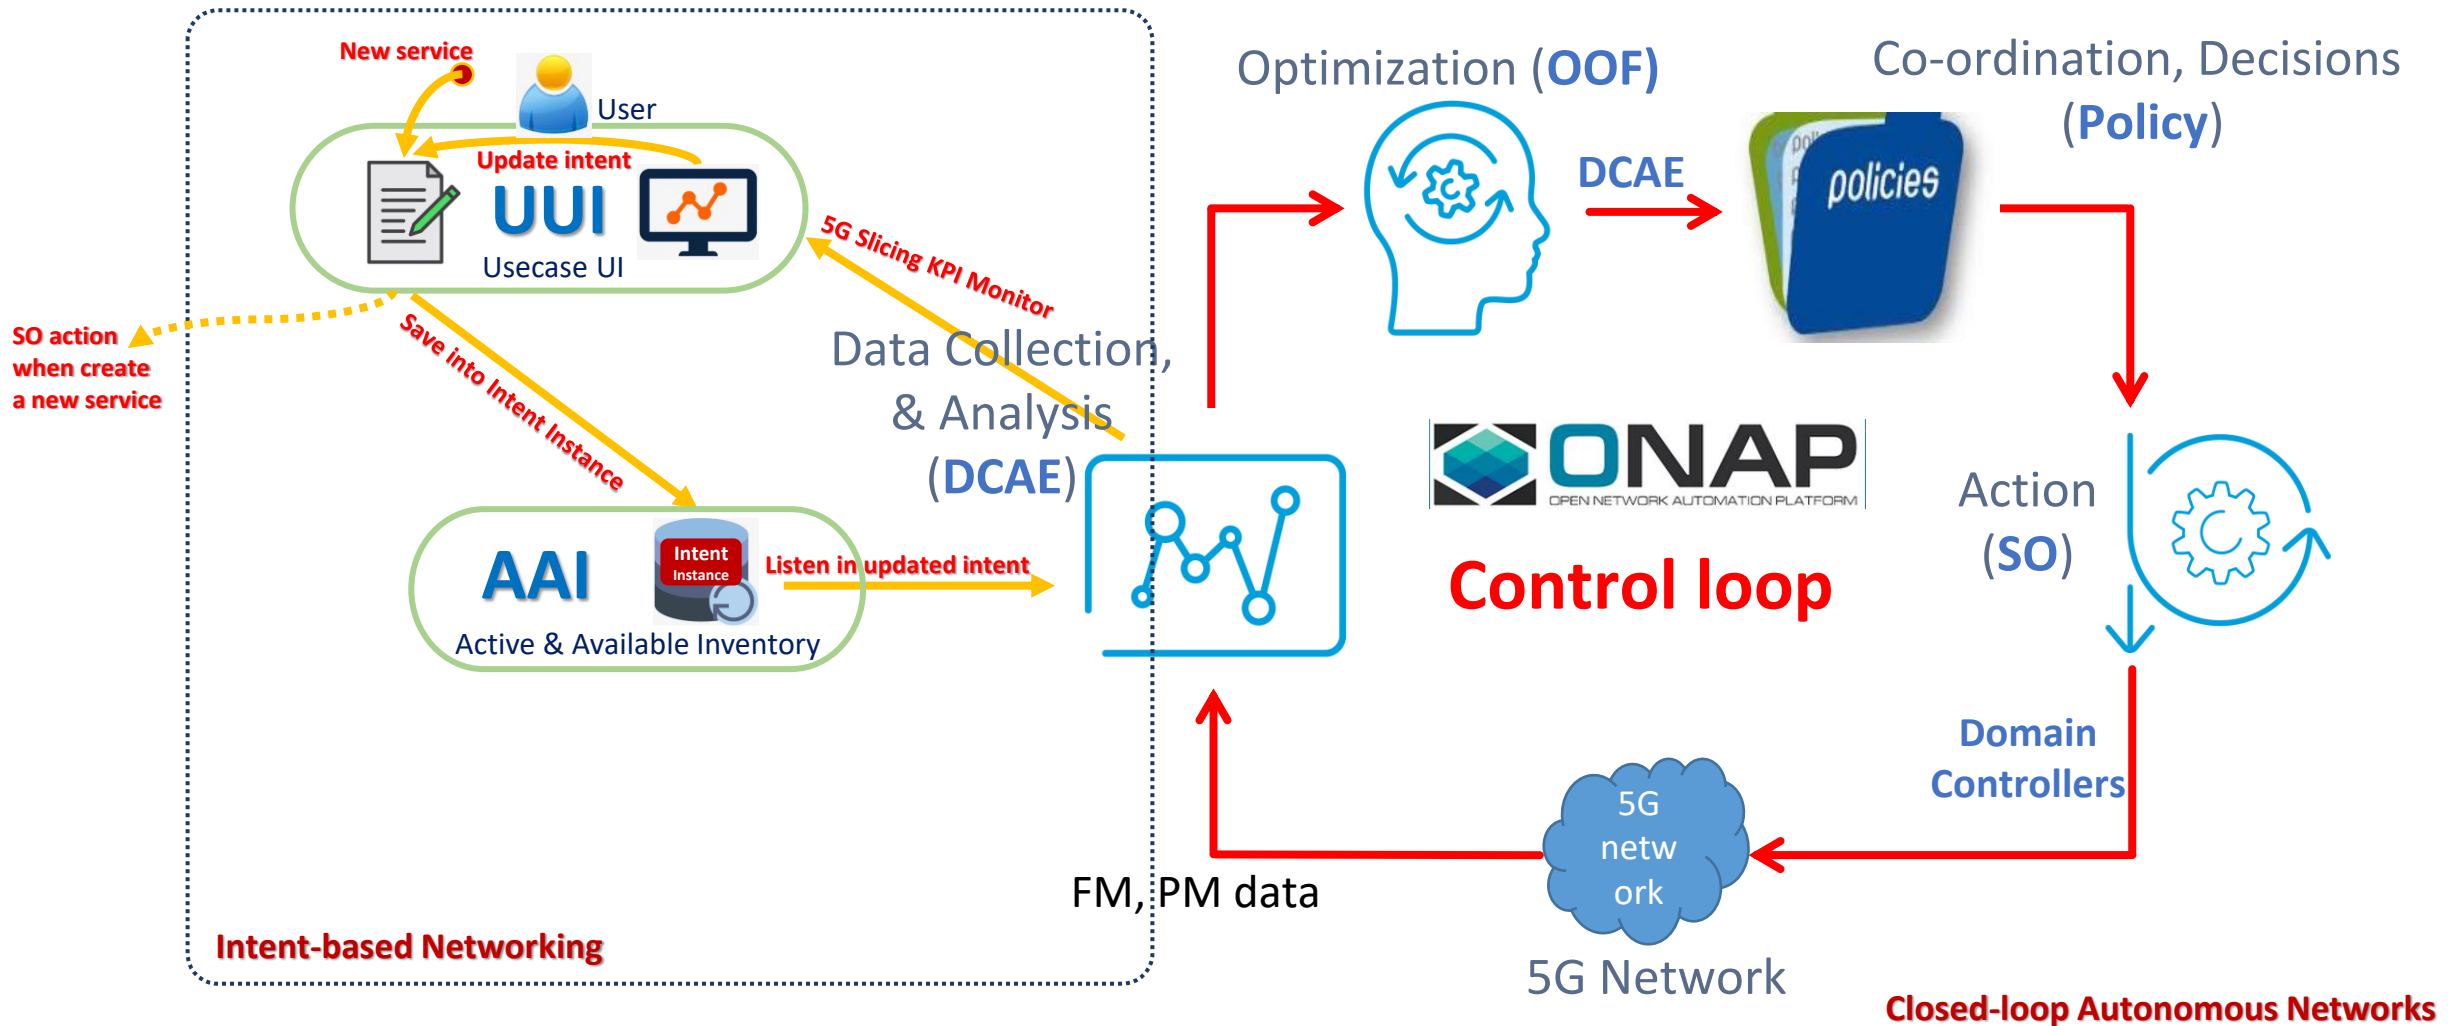

**ONAP**

OPEN NETWORK AUTOMATION PLATFORM

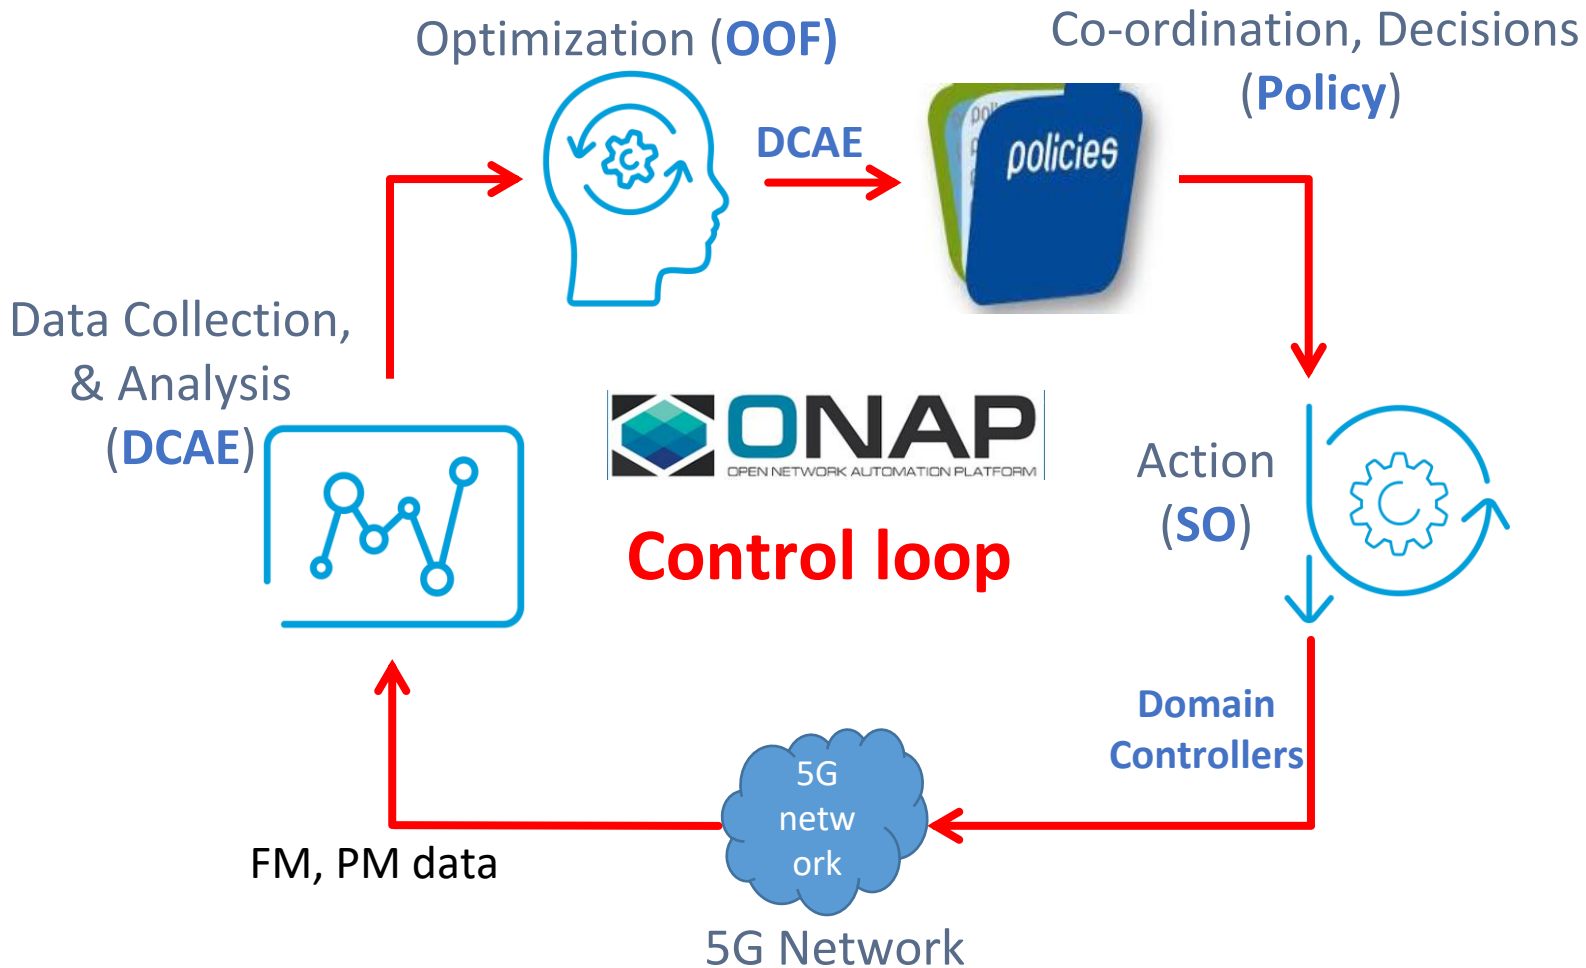

Thank You!

# 3.4 Intent-driving E2E Slicing usecase

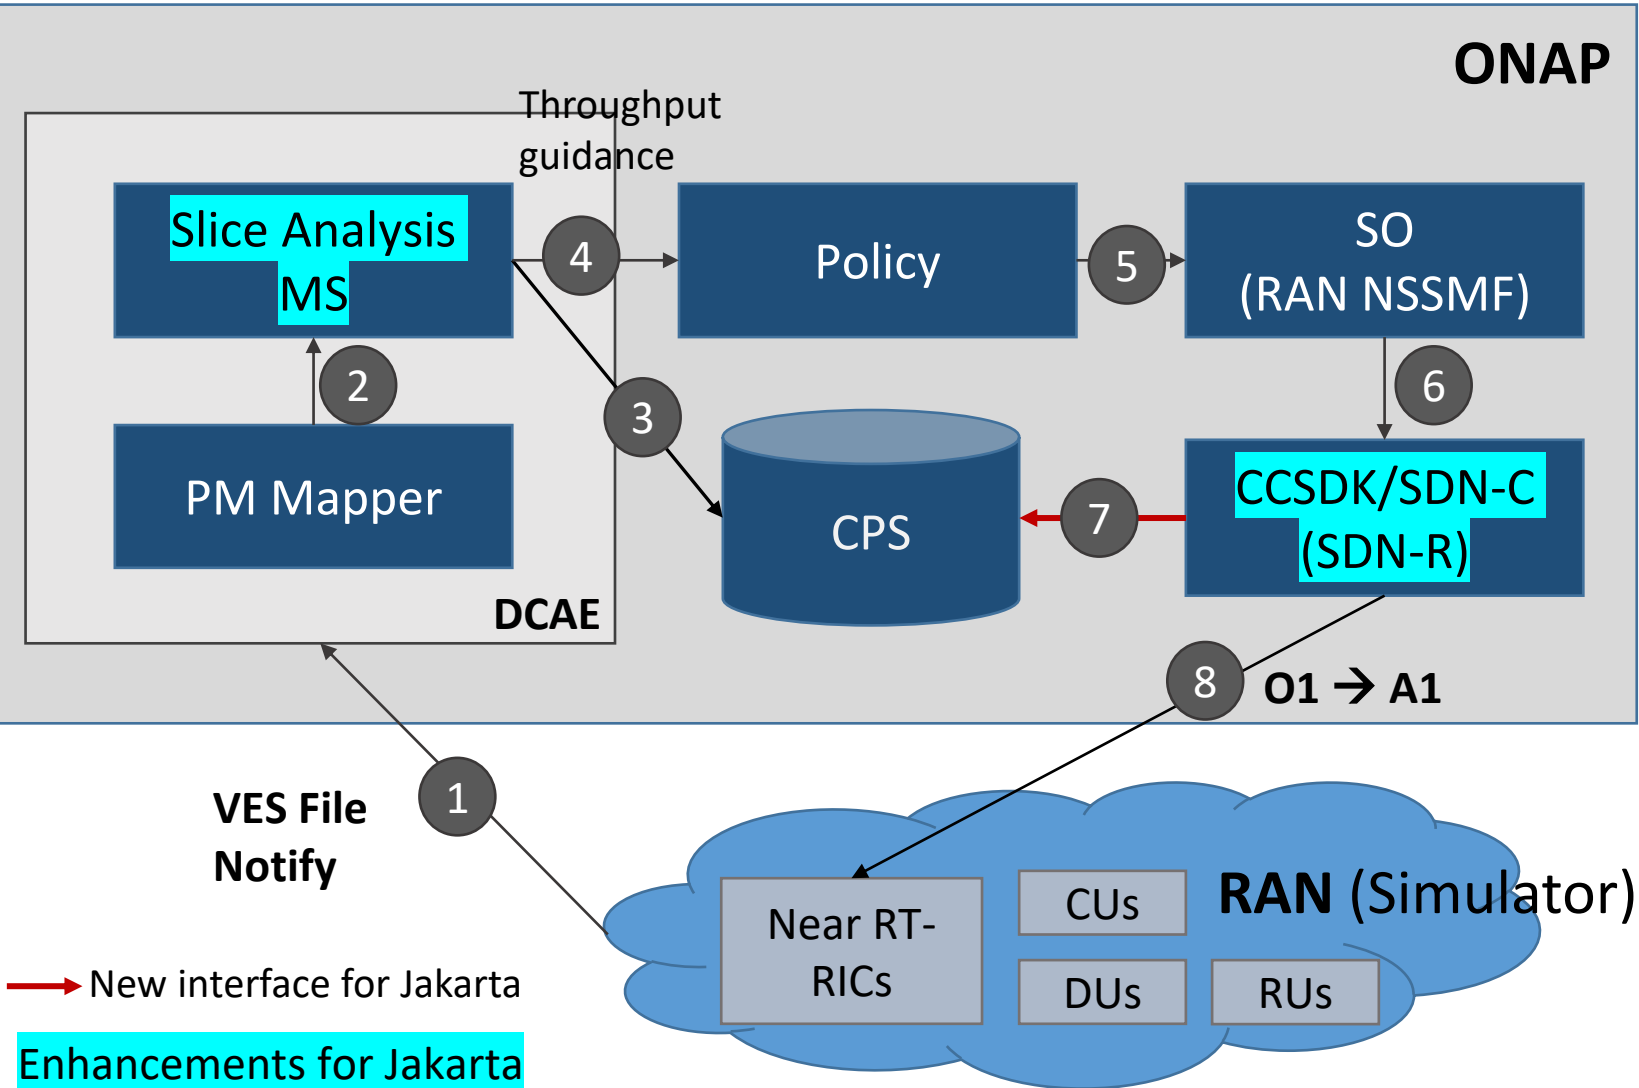

# Closed Loop: Overview

- Leverage the SON ↔ Control Loop (CL) framework in ONAP
- Based on PM/FM data, analyze NSI/NSSI traffic patterns, KPI adherence, and resource occupancy in NSI/NSSI
- Based on analysis, trigger OOF for NSI resource optimization/re-allocation to guarantee KPI adherence and optimal use of resources
- Perform necessary resource adjustments via SO and Domain Controllers (modify NSI/NSSI/S-NSSAI mapping/etc.)

# Closed Loop: Jakarta Release Impacts

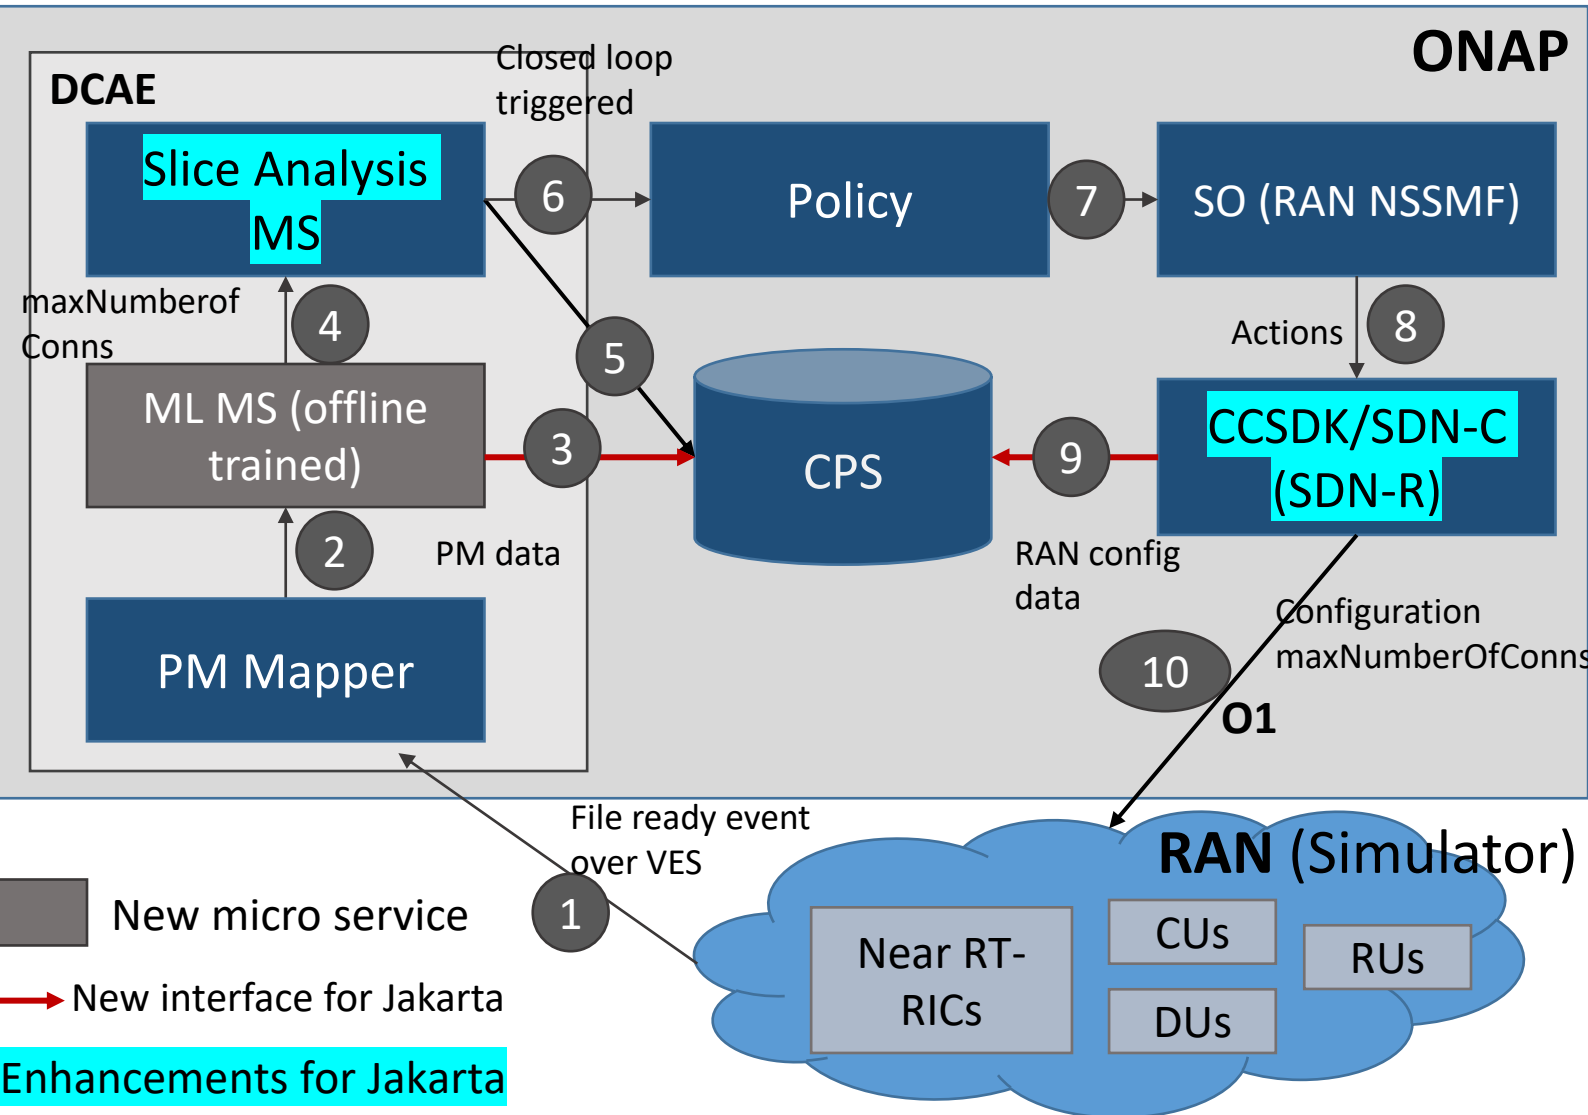

- The PM data collected from RAN in Step 1 is DL/UL PRB usage for data traffic.
- The configuration update determined by Slice Analysis MS and triggering Policy in Step 4 is slice specific throughput guidance for Near-RT coverage area (i.e., at Near-RT RIC level).
- Step 8 is over **O1** in Jakarta, it will be over **A1** in future releases.

**Notes:**

1. DFC and VES Collector are not shown in the flow but are used.

# Intelligent Slicing (IBN Based CL): Jakarta Release Impacts

- The PM data collected from RAN in Step 1 is PDU sessions requested, setup successfully & failures.
- 2 micro services are required, one for training and exporting the model (downloaded to the local machine in J release), and another for prediction.
- At Step 4, predicted output from ML MS, which should be aligned with the intent, is slice specific maxNumberOfConns for each cell (i.e., cell level for each S-NSSAI).
- Control loop is triggered by Slice Analysis MS using policy
- Step 10 is over O1 in Jakarta and will be over A1 in future releases

## Notes

- DFC and VES Collector are not shown in the flow but are used.
