PNF PnP: MODELING ENHANCEMENTS

DESCRIPTION

- (1) PNF MODELING** – Modeling enhancements to support 5G PNF in ONAP. Model Inheritance definitions for PNF. SDC modeling improvements from Beijing PnP use case. Updated NF Model to include software_versions. Integration of software_versions
- (2) PNF SHARING** – SDC model updates for PNF characteristics focusing on PNF inter-connectivity. (Dublin)
- (3) PNF-SDK** – SDK provided from Vendors. This will help modeling the Physical “Box” (PNF) and network functions. (Dublin)
- (4) CDT ENHANCEMENTS** - Improving CDT to handle complex config templates, multiple templates per PNF, identify different sources for template data, integrating CDT into SDC, expanding CDT usage to other controllers. (Dublin)

Network Planning

OPENStack – Image Repository in Glance. In VNF service designer request different version of S/W than is one in PNF itself

ASSETS MANAGED (WIKI)

Resource: a fundamental capability, implemented either entirely in software, or as software that interacts with a hardware device. Each Resource is a combination of one or more Virtual Function Components (VFCs), along with all the information necessary to instantiate, update, delete, and manage the Resource. A Resource also includes license-related information. There are three kinds of Resource:

- Infrastructure (the Cloud resources, e.g., Compute, Storage)
- Network (network connectivity functions & elements);
example: a Virtual Network Function (VNF)
- Application (features and capabilities of a software application); example: a load-balancing function

Service: a well formed object comprising one or more Resources. Service Designers create Services from Resources, and include all of the information about the Service needed to instantiate, update, delete, and manage the Service

Product: includes one or more Services packaged with commercialization attributes for customer ordering, billing, and issue resolution. Products are created by Product Managers, and can have one or more "category" attributes assigned by Product Strategists.

Offer: bundling of Products with specific Marketing configurations for selling to customers

SDC COMPONENTS (WIKI)

There are four major components of SDC:

The **Catalog** is the repository for assets at the Resource, Service and Product levels. Assets are added to the Catalog using the Design Studio.

The **Design Studio** is used to create, modify, and add Resource, Service, and Product definitions in the Catalog.

The **Certification Studio**, available in a future release, is used to test new assets at all levels. It will be used for sandbox experimentation, and will include support for automated testing.

The **Distribution Studio** is used to deploy certified assets. From the Distribution studio, new Product assets, including their underlying Resources and Services, are deployed into lab environments for testing purposes, and into production after certification is complete. In a future release, there will be a way to export Product information to external Business Support Systems for customer ordering and billing.

SDC COMPONENTS (WIKI)

1. Resource Model

(The one, which is defined in SDC, and defines those relevant resource parameters, which characterize services running on top of that resources, or allows these resources to bring relations to other resources in a service definition) Possibly, this is as well an interaction model – how different VNFs interact with each other, what relations are they building?

2. Inventory Model

(The one, which defines, which configuration/instance parameters are stored per resource/service instance – e.g. concrete IPs or Serial Numbers, that are assigned to concrete instances)

3. Configuration Model

(The one, which defines, which configuration parameters are required/exposed as application parameters to e.g. controllers)

4. Event “model”

(How the events, that we`re generating look like – what are their structures/elements/ what is the meta-data that is used around them?)

A side-effect of this one is “interaction model” – so which actions are we taking, when we discover, that there is something wrong with the xNF based on this model contents.

VNF vs PNF Comparison

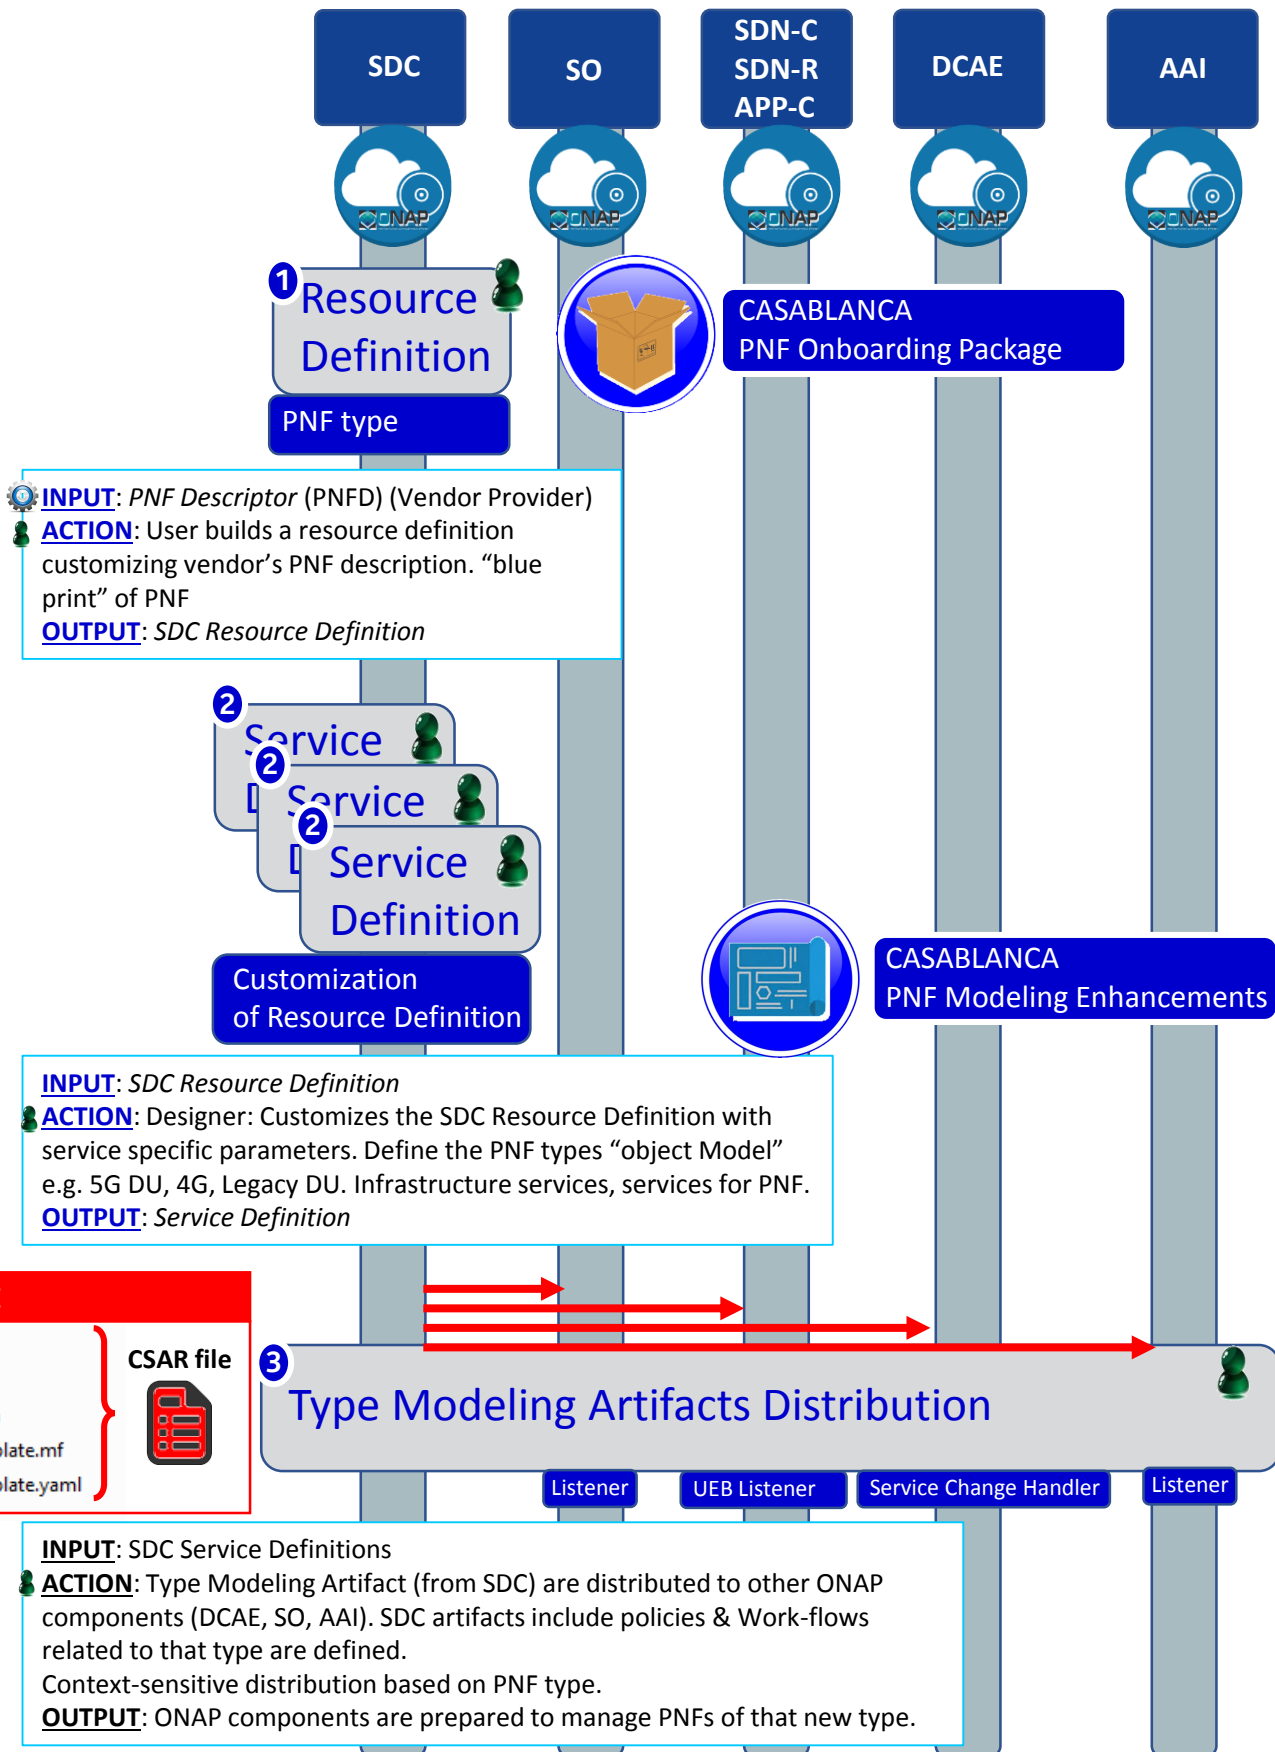

TOPIC	VNF	PNF
Concept	Application fulfills the role of a network function.	It is a network element, a physical entity, which can implement the role of a network function.
Physical Characteristic	Application without dedicated hardware; Virtualized applications require specific capabilities; Run on different vendor servers. SRIOV, Inter-DPDK. Hardware capabilities.	Has an actual physical asset that is deployed and associated directly with the PNF.
On-boarding	To onboard a VNF is to “bring it into ONAP” i.e. the VNF images, component VNF-C provide descriptors of these NFs. Deployment model, # components, functions. Configuration parameters. VNF is not tied or optimized for a specific hardware, only requiring perhaps some capability to be supported.	For PNF provide the descriptors. Only provide the meta-data. PNF S/W specifically optimized to run on dedicated hardware. (Now) Not the software image. (Future) ONAP will provide the software image repository.
Plug and Play	The model triggers the orchestration.	(See this slide package for PNF Plug and Play) at the end of PnP the PNF can provide service.
Characteristics	5G CU could be a VNF since there is no need to have an association to a physical environment.	5G DU must be PNF. PNFs are Elements which may need to interact with the physical environment. PNF is “High-Touch” technology. E.g. Emit radio waves in a geographical area.
Configurability & Deployment	Easily adaptable to functions that you expect. E.g. Packet gateway to reconfigure as different NFs. Services easily create instances reconfigures including deployments (for different applications). Use a different instances of the VNF to provide a new service. For a VNF you can easily “delete” and “create” a new VNF to perform a new function. Configured dynamically.	PNF has a “fixed” set of capabilities but can’t easily reconfigure it. One PNF in multiple services. Different capabilities exposed by the PNF. Reuse the same PNF with different services configuration. For a PNF you would not “destroy” a PNF but rather re-configure it. Can be configured dynamically.
ONAP Interaction	ONAP is started with VNF. VNF is “deployed” on-demand. Control from the ONAP perspective when a deployment of a VNF happens. DCAE – same Configure – Chef, Ansible	PNF do not “deploy” application. Do not use multi-VIM. Only “configure” the application, the PNF is deployed. A technician goes to site and “deploys” a PNF. DCAE – same Configure –Implementation of PNF client. Communication protocol, Client
Design Time Modeling	Model VNF. Templates. Onboarded before. In Run-time. Make sure properly identify specific PNF instance already deployed. Vs a dynamically created instances. VNF instances could be created & instantiated dynamically. SDC may assumed instantiation of network function.	PNF cannot be instantiated, a PNF is only instantiated when it “powers up” and connects to ONAP. Service Orchestration. PNF is instantiated by nature of a PNF installation & commission procedure.
Service Orchestration	VNF cloud, #VM resources consumption, define components implement different functions. Where & What will be deployed.	Physical location, pre-provisioned capabilities, performance monitoring. Components installed. RUs for specific functions.
Resources	VNF dynamically assigned resources.	PNF statically associated (hardware) resources.
Capacity	VNF Capacity can be dynamically changed	PNF is static (number of cells supported)

NF Modeling in SDC IN CASABLANCA (R3)

- ONAP and NF Plug and Play for 5G RAN
- 5G Use Case Team

Design Time (ONAP)

SDC

SO

SDN-C
SDN-R
APP-C

DCAE

AAI

1 Resource Definition

PNF type

CASABLANCA
PNF Onboarding Package

INPUT: PNF Descriptor (PNFD) (Vendor Provider)
ACTION: User builds a resource definition customizing vendor's PNF description. "blue print" of PNF
OUTPUT: SDC Resource Definition

2 Service Definition

Customization of Resource Definition

CASABLANCA
PNF Modeling Enhancements

INPUT: SDC Resource Definition
ACTION: Designer: Customizes the SDC Resource Definition with service specific parameters. Define the PNF types "object Model" e.g. 5G DU, 4G, Legacy DU. Infrastructure services, services for PNF.
OUTPUT: Service Definition

CSAR file

data
template.mf
template.yaml

3 Type Modeling Artifacts Distribution

Listener

UEB Listener

Service Change Handler

Listener

INPUT: SDC Service Definitions
ACTION: Type Modeling Artifact (from SDC) are distributed to other ONAP components (DCAE, SO, AAI). SDC artifacts include policies & Work-flows related to that type are defined. Context-sensitive distribution based on PNF type.
OUTPUT: ONAP components are prepared to manage PNFs of that new type.

STEP	DESCRIPTION
1	<p>RESOURCE DECLARATION – A user on the VID performs a Resource Declaration. This uses the Service definition created in SDC. The user on the VID can define known information about the PNF. The user can (optional) provide the following information</p> <p>PNF RESOURCE Definition</p> <ul style="list-style-type: none"> Resource Type – Type of Resource. NEW type: PNF (pre-defined in SDC) NAME – Name of the PNF type CATEGORY – e.g. Infrastructure TAGS – User-definable tags (default name of the PNF) DESCRIPTION – Textual description CONTACT ID – Designer (user of ONAP) VENDOR – PNF Vendor (e.g. Nokia) VENDOR RELEASE – Vendor release VENDOR MODEL NUMBER – PNF Model value (link to A&AI) EVENTS – Monitoring Event definitions. Define design-time templates. CLAMP (runtime monitoring), DCAD (design time design template attach to VNF). Define templates & attach them. <p>Note: The user may provide whatever information in the above fields they know. Note: Consumer vs Enterprise deployments. Consumer systems pre-registered, distributed throughout a region. For a consumer deployment you might not know the MAC address/Serial number (PND IF) until the PNF connects to ONAP.</p>
2	<p>SERVICE Definition (uses a PNF)</p> <ul style="list-style-type: none"> NAME – Name of the Service (mandatory) CATEGORY – e.g. Network L1...L4, VOIP call Control, Mobility TAGS – User-definable tags (default name of the PNF) DESCRIPTION – Textual description of service (mandatory) CONTACT ID – Designer (user of ONAP) (mandatory) PROJECT CODE – ID (mandatory) Ecomp-Generated Naming – Name Naming Policy – Policy to be used to assign a name to a service by SO/SDNC SERVICE TYPE – Type of service SERVICE ROLE – The Role of this service. ENVIRONMENTAL CONTEXT – distributed environments Specific Service(?) – PNF, allotted resource from a CU Service <p>The “basic” model are extended. Inherit (OO) from existing model. Vendor takes standard node types and creates their own extension. CDT (Configuration Design Tool) (GUI) to build artifacts to be used by APP-C (Tosca models) for a configure Template.</p>
3	<p>DISTRIBUTION – Event Monitoring Templates distributed. (?)</p>

PNF PnP: MODELING ENHANCEMENTS

DESCRIPTION

- (1) PNF MODELING** – Modeling enhancements to support 5G PNF in ONAP. Model Inheritance definitions for PNF. SDC modeling improvements from Beijing PnP use case. Updated NF Model to include software_versions
- (2) PNF SHARING** – SDC model updates for PNF characteristics focusing on PNF inter-connectivity. (Dublin)
- (3) PNF-SDK** – SDK provided from Vendors. This will help modeling the Physical “Box” (PNF) and network functions. (Dublin)
- (4) CDT ENHANCEMENTS** - Improving CDT to handle complex config templates, multiple templates per PNF, identify different sources for template data, integrating CDT into SDC, expanding CDT usage to other controllers. (Dublin)

PROJECTS

SDC, CDT

PNF ONBOARDING / PNF PACKAGE

DESCRIPTION

PNF Onboarding and PNF Package

(1) PNF PACKAGE DEFINITION – Defining *PNF Onboarding Package*. Extending framework to work with PNFs. Defining Package framework.

- A. **PNF ARTIFACTS DEFINITION** – Vendor specific/provided artifacts to add to the (new PNF) package. (Dublin)
- B. **PNF ARTIFACTS DISTRIBUTION**

TOSCA Meta data - main service template, TOSCA template.

Artifact Package. Separated by types of artifacts. Separations by folder for different types. Place artifacts in categories. Anyone can choose which artifacts to receive.

Definitions – Specifies definitions such as CM, FM and PM definitions

(1) Protocols Supported – PNF package. CM Protocol is in PNF onboarding package. (Chef, Ansible, NetConf)

(2) Controller – What is the PNF controller

PROJECTS:

SDC, APP-C

NF SDC & Modeling Project Impacts Overview

- ONAP and SDC NF Modeling for 5G RAN
- 5G SDC Project

PROJECT IMPACTS FROM ONBOARDING

ONAP Project	IMPACT
SDC/ Modeling	Modeling Project - (No License management impact – See Futures Section) [See follow-on Slides “MODELING”]
VNF-SDK (PNF-SDK) Validation	<p><u>PNF PACKAGE DEFINITION</u></p> <p>PNF packages similar to VNF packages. PNF Descriptors, artifacts. In PNF not doing deployment process in SDC. Only PNF configuration. Model a PNF. Onboard PNFs (create templates service configuration). Orchestrate a service on a PNF. Service provisioning. Life cycle: Template/service orchestrated. For PNF every PNF vendor makes this package. Need specific PNF properties. Image details. ONAP updates the image.</p> <p><u>VALIDATION OF A SDK PACKAGE</u></p> <p>VNF-SDK (validation, Package definition, verification tool) – package compliant. Allows creation/validation of packages. PNF-SDK <i>validates</i> the package.</p>
WORK FLOW (SDC)	Create work-flow for PNF (Srini) SDC Impacts related to work-flow. ACTION: Sample Work-flow for PNF. vCPE, PnP (Sub) W/F are supported in R3. 5G RAN W/F R4.
MONITORING (SDC)	Monitoring definitions – SDC has a side monitoring template designer. Way to define monitoring alarms etc; In AT&T there is a project; IN ONAP code is there finalizing code; pluggable modeler for monitoring. DCAE as part of onboarding specify what VES template. DCAE-DS [Design Studio] define microservices for monitoring. How is PNF monitored & correlated. If [x] goes down how is this correlated. SDC would define the Modeling what needs to be monitored and how they would correlated with other events from other NE. Thresholds. [Baby step to process get an alarm from PNF, YAML file describes fault VES event, Fault meta-data; alarms generate]. Alarms raises are documented in SDC. Upload an “Artifact” file (Alarm Dictionary / Fault Meta-data / YAML, YANG). Vendor Specific. Demo and separate discussion. How monitored – processing in DCAE-DS (Design Studio time). Based on design time data DCAE is done in. (No open point for Casablanca R3)

DCAE-DS IMPACTS

OVERVIEW - DCAE-DS generates the **templates** for monitoring the models. DCAE-DS is model-driven. It specifies which monitoring microservice are utilized in monitoring a specific service model. Cloudify blueprints specify the requirements on micro-service and are configured by a user. Configurations are distributed to components who subscribe to that specific type of artifact.

DCAE-DS TEMPLATES – monitoring templates composition of micro-service to be used (open/closed loop). The templates are *Cloudify Blueprints*. E.g. Micro-Service collectors, analytics, monitoring. VES collectors, holmes. A micro-service that is part of a monitoring flow that a designer can design that can be reused for difference service models. A building block represented by TOSCA models. First needs to be represented by development team. Monitoring template certified.

DCAE-DS GUI - DCAE-DS is a pluggable designer in SDC provides a GUI to the user that selects/composes the micro-services, or use predefined templates, for specific flows. E.g. SNMP type of flow or different protocol. User can configure different micro-services according to requirements to the model.

PNF PLUG AND PLAY – Cloudify Blueprints (for a [1:X] service) has (UUID, Micro-service values, Properties, service specific policies). What are we trying to Monitor? SDC Service-Package attached to VF-Level.

MODELING IMPACTS

Notes:

- 1) **EXTERNALS** - Not trying to model the internals of PNFs. What is exposed by the box is what is modeled.
- 2) **INTERRELATIONS** - Focus on relations of PNFs/VNFs. Interworking between PNFs/VNFs.
- 3) **VISIBILITY** - CP/UP visibility
Not M-Plane (as this is 3GPP standardized)
- 4) **MODELING ANALYSIS** - Modeling activity to assess PNF, and check SDC model is sufficient to cover Casa use cases if additional parameters need to be added (e.g. relations between other NFs). Expanding the “Release 0 model” for Casa. PNF type vs PNF instance. Design-time vs Run-time model.

 Suggested VES Event Entry - Fault' Domain Datatypes
For Alarm Dictionary Index (in **Dublin**)

Alarm Index	Dictionary	number	No	Alarm Dictionary Index, (since optional if left blank would mean dictionary is not used)
----------------	------------	--------	----	--

PNF PACKAGE

PNF has no onboarding package.

Just model the PNF from the modeling screens.

CSAR – decompile info stored in SDC model.

In VNF flow. Onboard the VNF. VNF cataloged as a version to be used. Check-in/check-out. After onboarding can add more artifacts and certify the VNF. A “building block” to be used in different services. Generic, the structure will be the same. E.g. 2000 ports vs 10 ports. “Ports”. How to comm w/ PNF what to do w/ PNF. Specific work-flow or configuration. PNF & VNF similar. SO will orchestrate, already exists in ecosystem.

Modeling of the Service. E.g. Connection point what will connect to the PNF.

ARTIFACTS

DEFINITIONS

PNF – 5G Base Stations

Backhaul Ports – PNF & VNF and want to communicate. In a VNF can describe a port a TOSCA.

Model onboarded understand what can connect to what. CP connections. Can see they can connect. Model needs to capture info for modeling parts representing connections. Model allow someone designing service to connections. Or requirements from VNF/PNF from the model. A virtual link. One VNF & PNF connected via virtual network/link.

PNF Work-flows – initialization, triggered when connecting to PNF. Configuration/registration that needs to be done. DNS pre-loaded. Location. Policies attached to PNF, High volume # of PNF deployments, port-allocation. *Capabilities. Triggered by orchestrator as part of the instantiation.*

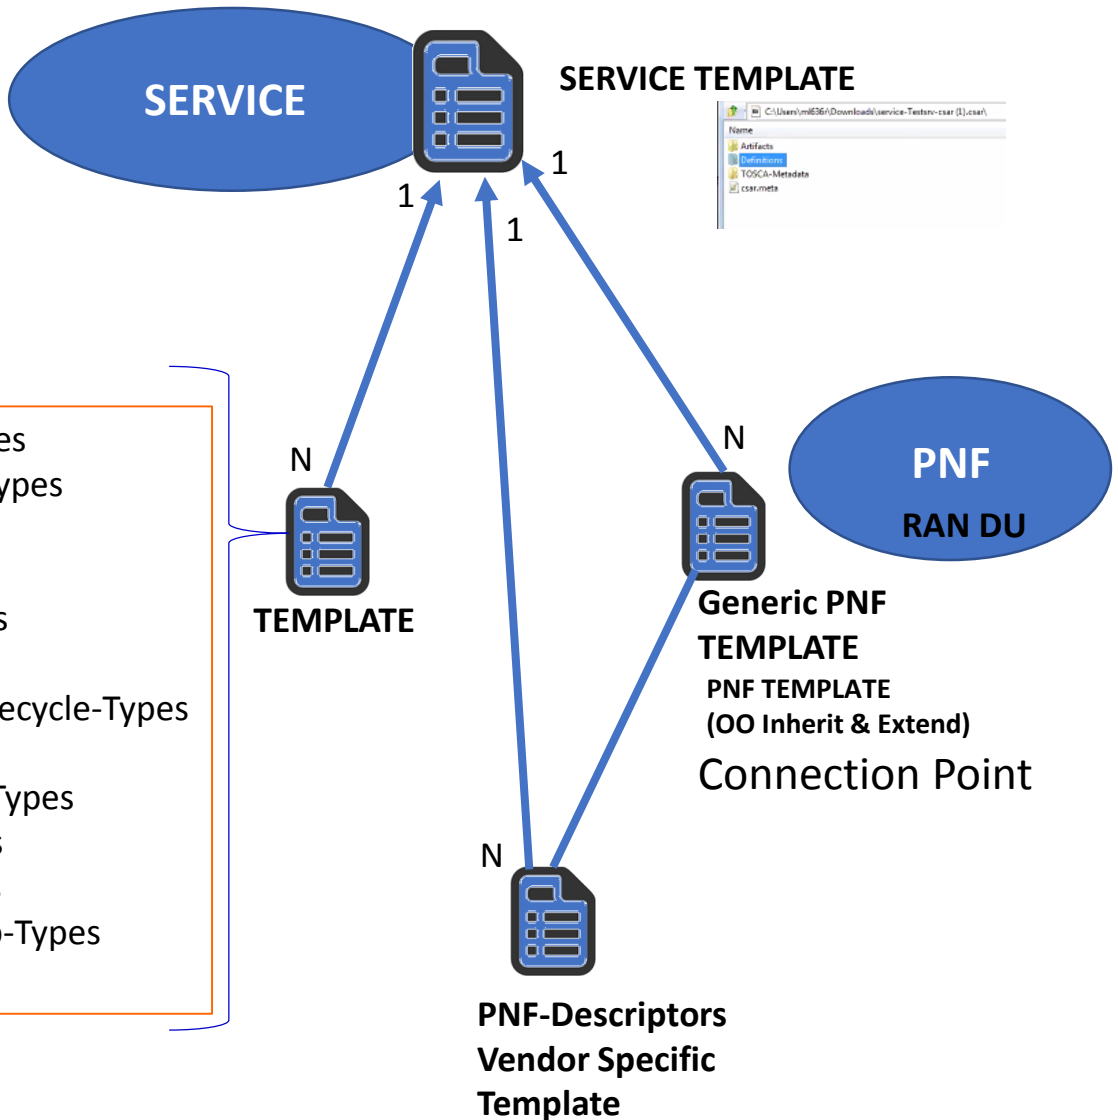

PNF Policies -

Tilt – (Antenna Tilt - RF) – not related to PNF / VNF communicate.

Software Version

Modeling Project, VNF-SDK (validation, Package definition, verification tool) – package compliant

NFD DESCRIPTOR (PNFD, VNFD)

- ONAP and SDC NF Modeling for 5G RAN
- 5G SDC Project

PNF Descriptor

PNFD Definition in ETSI-NFV-IFA014v242

Attribute	Qualifier	Cardinality	Content	Description
pnfId	M	1	Identifier	Identifier of this Pnfd information element. It uniquely identifies the PNFD.
functionDescription	M	1	String	Describes the PNF function
provider	M	1	String	Identifies the provider of the PNFD.
version	M	1	Version	Identifies the version of the PNFD.
pnfInvariantId	M	1	Identifier	Identifies a PNFD in a version independent manner. This attribute is invariant across versions of PNFD.
name	M	1	String	Provides the human readable name of the PNFD.
pnfExtCp	M	1..N	PnfExtCpd	Specifies the characteristics of one or more connection points where to connect the PNF to a VL. See clause 6.6.4.
security	M	0..1	SecurityParameters	Provides a signature to prevent tampering.
geographicalLocationInfo	M	0..1	Not specified	It provides information about the geographical location (e.g. geographic coordinates or address of the building, etc.) of the PNF. The cardinality 0 is used when the location is unknown.

From Potential PNF template for PNF S/W management & change management (Lixiang,YaoguangWang, ChangMing Bai Hwawei)

Basic Content of PNF template **PNF-D (DESCRIPTOR)**

Contents	Description
pnfdId	Identifier of this Pnfd information element. It uniquely identifies the PNFD.
provider	Identifies the provider of the PNFD.
PNFD version	Identifies the version of the PNFD.
pnfdInvariantId	Identifies a PNFD in a version independent manner. This attribute is invariant across versions of PNFD. (pnfdInvariantId would be inside the meta-data in ONAP)
name	Provides the human readable name of the PNFD.
security	Provides a signature to prevent tampering.
pnfInformation	Describes the PNF information
pnfSoftwareVersion	Software Version supported PNFD.

SDC PNF MODEL (R3 Casablanca)

Contents	Description
pnfId*	Identifier of this Pnf information element. CORRELATIONID (A&AI). ACTION: Discuss further
pnfType (template)*	Type of Resource. NEW type: PNF (pre-defined in SDC)
Category*	PNF category, e.g. infrastructure
Vendor (template)*	Identifies the vendor of the PNF. MANDATORY
Name*	Provides the human readable name of the PNF.
vendorrelease *	Vendor release. MANDATORY
vendormodelNumber*	PNF Model value (link to A&AI)
functionDescription*	Describes the PNF function
software_versions	The EXPECTED software to be supported by the PNF. (see TOPIC: SWVersionList)

Sept 4 ACTION – SDC working with integration team that will use software_versions. Ben will ask on the Thursday (SW Upgrade Use Case Call)

ACTION – Coordinate Modeling Calls? (For Michael Lando) (Tues) “Merge” every once in a while to Sync up. Contact: Deng Hui

***Already supported in Beijing**

TOPIC: SOFTWARE_VERSIONS (R3)

July 31, 2018 Discussion about **software_versions**

TOPIC:

software_versions in the PNF Model (in Casablanca R3)

Problem Statement: How will it be defined in SDC

Objective want to have a list of S/W versions

SOLUTION

Will be a **property (STRING)**

REASON: Meta-Data can't have lists so modeled as a Property.

TOSCA model has different sections

Notes: Vendor/resource version as META-DATA for NF

If this is a property has different set of validations

Properties are model information

Inputs to set properties.

Meta-Data (section of TOSCA model of PNF)

Constraints can be imposed upon Properties

An enhancement on "meta-data" which you can impose

Proper / valid values upon the Properties.

New DATATYPES would need to go through Modeling Sub-committee

Discussion

Linda Horn (Nokia) "don't we only need ONE Expected S/W version?"

Li Xiang (CMCC) "we need a list"

DESCRIPTION for software_versions – to highlight features in a SW version.

e.g. the set of Services the S/W is targeted for.

• Content of PNF software version List

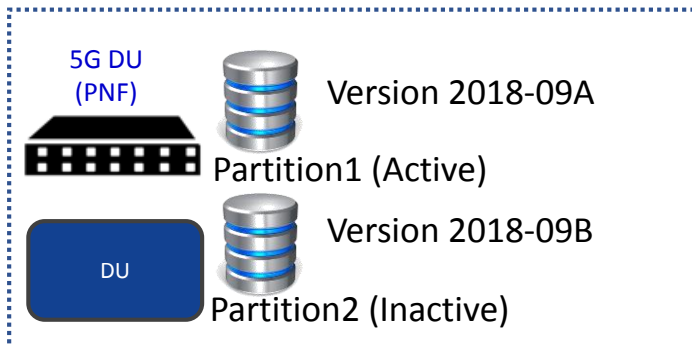

Contents		Description
softwareList	description	Describes the main feature of the this software version
	swVersion	Software version STRING

TOPIC: Use Cases for SWVERSIONLIST (R3)

Use Cases that use Software Version LIST	Description
Troubleshooting	Troubleshooting software defects and tracking & isolating problematic software
Network Analysis	Metrics, Data-mining, analysis on PNF and VNF based on software developments.
Correlation Version	KPI, Performance, and operational analysis based on software version and regional correlation.
Error Checking	Mis=deployed software, error correction and analysis.
Modeling informational	Modeling software versions and feature planning
Network Planning	Regional and area planning for software deployment and rollout.
Software Management & Inventory	Feature roll-out and tracking, software management and inventory tracking
Software Upgrade (Network wide)	Service Provider wants to upgrade a network (or fallback a network) to a new software version. Region #1 – v1; Region #2 – v2.

TOPIC: Use Cases for SWVERSIONLIST (R3)

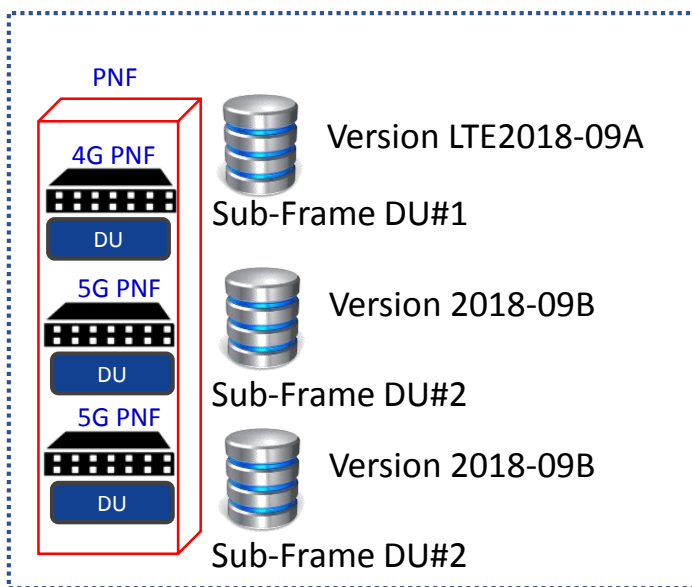

DRIVE PARTITIONS

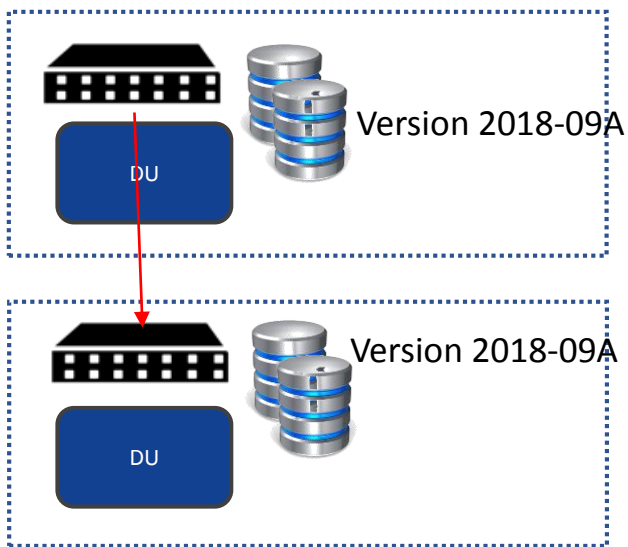

SUBCOMPONENTS (R4+)

TANDEM CHASSIS CONFIGURATIONS

MULTI-PNF DAISY CHAIN DEPLOYMENT

TOPIC: Use Cases for SWVERSIONLIST (R3)

Use Cases that use Software Version LIST	Description
Software Upgrade (Network wide)	Service Provider wants to upgrade a network (or fallback a network) to a new software version. Region #1 – v1; Region #2 – v2.

Area #1

Modelled for NF
Software Version
2018-09A

Area #2

Modelled for NF
Software Version
2018-09A

A planner is responsible for an ONAP deployment that covers a set of areas, in this case #1 and #2.

For this particular use case/application (of this parameters), a class of PNFs is allowed to have a set of Software versions in this case 2018-09A and 2018-09B.

SDC PNF MODEL (R4) Dublin+

Contents	Description
pnfid*	Identifier of this Pnf information element. CORRELATIONID (A&AI). ACTION: Discuss further
pnfType (template)*	Type of Resource. NEW type: PNF (pre-defined in SDC)
Category*	PNF category, e.g. infrastructure
Vendor (template)*	Identifies the vendor of the PNF. MANDATORY
Name*	Provides the human readable name of the PNF.
vendorrelease *	Vendor release. MANDATORY
vendormodelName*	PNF Model value (link to A&AI)
functionDescription*	Describes the PNF function
software_versions (opt)	The EXPECTED software to be supported by the PNF. (see TOPIC: SWVersionList) Introduced in R3/Casas
pnfExtConnPt (modelling def. of connection pt not a template)	 <p>Specifies the characteristics of one or more connection points where to connect the PNF to a VL. Align ETSI SOL-001. ML: connection pt model in TOSCA TEMPLATE not as properties.</p>
contactId (metadata)	<p>Designer (user of ONAP) ML: Need for this, Audit/tracking, User creates audit log not associated with model itself. 19-Jul – REMOVE THIS PARAMETER</p>
PackageVersion	 <p>The version of the PNF Package. 19-Jul – Not going to onboard the PNF, model it from scratch. Define in SDC.</p>
NF Controller	Controller for PNF (APP-C, SDN-R, SDN-C, VF-C)
Technology Domain	Technology Domain

TOPIC: R3 NF YAML DEFINITIONS

August 7, 2018

PROBLEM STATEMENT:

We need to Store a YAML registration event in the SDC Catalog.

Note: The YAML registration event is necessary to validate emitted by PNF Is expected

Emitting what it is supposed to be emitting.

SOLUTION (Casablanca R3)

Manually uploaded to different systems

If no monitoring defined, can define information manually

PnP FLOW (updated Wiki)

[Added Note & PNP-1310] in Wiki

<https://wiki.onap.org/display/DW/5G+-+PNF+Plug+and+Play>

LONG TERM SOLUTION

PNF Onboarding – Packages

Associating a Controller for a NF

- ONAP and PNF Plug and Play for 5G RAN for Dublin R4
- 5G Use Case Team

NF Controller (R3 Casablanca)

PROBLEM STATEMENT

Associating the ONAP Platform Controller (APP-C, SDN-C, VF-C) for a NF

RESULT

e.g. SO knows which API to use for NF controller
LCM policy engine, DCAE, Change management, S/W Download

NF

OTN PNF (CCVPN), Router PNFs (Optical Domain), 5G DU RAN (Wireless Domain) are PNFs are relevant

SOLUTION (R3 Casablanca)

SDN-C, Hard-Code controller to PNF.

“Hard code” Generic-API (PNF Plug and Play UC)

OBJECTIVES (Long-Term Goal)

As automated as possible

Using discovery if possible

Flexible operator could design PersonaA for PNF1, PersonaB for PNF2

Take into consideration the capability & functions of the Controller

In general, would not want different controllers handling same NF instance.

NF Controller Concepts

ONAP Deployment

ONAP Platform Controller (Run Time)

VF-C

SDN-C
SDN-R

APP-C

[New/Future]
X controller

Technology Domain

Wireless RAN

Optical

IoT

PROBLEM DESCRIPTION

Pictured above are three different kinds of PNFs. In orange are wireless (RAN) base stations, such as 5G DU units and their corresponding 5G VNFs. For Optical, there are SOTN PNFs for example as used in the CCVPN use case. Then pictured in green are IoT PNFs. These might include things like smart home units, smart doorbells and the like.

Each of these PNFs fall into a domain category, Wireless, Optical, IoT. These categories are just example categories. There will be many other divisions.

Each of these categories of PNFs & VNFs will have attending Controllers.

For any service provider, (w/ a mix of different vendor NFs, they will have the same Controller)

NF Controller Concepts

ONAP PLATFORM CONTROLLERS (*Persona*)

(SDN-C (SDN-R), VF-C, APP-C, xyz-C)

DESCRIPTION

ONAP Platform-Type controllers are SDN-C, SDN-R, VF-C and APP-C. These are specific types of ONAP projects that are controllers to NFs.

Regional CONTROLLER (*Instances*)

Regional Deployment (instances) of Controllers

DESCRIPTION

Regional Controllers are specific instances of ONAP platform-type controllers deployed to a particular region or responsible for a particular region. For example SDN-C deployment #1 responsible for the western part of a country, and SDN-C deployment #2 responsible for the eastern part of a country

ONAP Deployment #1

ONAP Deployment #2

External (to ONAP) CONTROLLERS

(OSS): EMS, NMS, Vendor proprietary controllers, etc

DESCRIPTION

ONAP External Controllers that reside outside of ONAP that perform management functions with the PNF and VNFs. Incl. Vendor-proprietary controllers e.g. SDN-C

NF Controller PROPOSALS (Goal)

PROPOSAL #1

NF Model (SDC Design Studio)

DESCRIPTION

To have the Controller as an attribute as a NF model is specified in the NF Model. Differences between PNFs & VNFs. The PNF has a req for a physical device, VNF does not. Both NFs need controllers.

Objection to model in SDC is that the VID user may not know the controller. The model designer & The Network Engineering should know.

Problem #1 - Requires designer to know the controller

Problem #2 - How is this managed (a hard-coded list) e.g. a 3rd party External Controller

PROPOSAL #2

Policy Driven

DESCRIPTION

A policy is designed which has the Controller used by the NF.

Problem #1 – That's not what the policy function does

Meta-Data of the Table (combined w/ idea #3)

Run-time Policy (to take up additions)

PROPOSAL #3

Dynamic Association (Table-Driven Approach)

DESCRIPTION

Table-Driven Look-up solution based on NF function type. For example a controller may support a particular technology domain (wireless/wireline/optical). Controller support domain and auto-populates the tables. Could be a GUI in SDC (a run-time catalog table). The Table could be onboarded. Design-time field. The PNF needs to have a "Technology" domain (a user or designer). Specific images (S/W loads) to specific Controllers.

NOTES/IDEAS

1 "ONAP platform type Controller" SDN-C (SDN-R) VF-C APP-C

2. Domain Controller - Controller-Instances (regional dependent)

ONAP deployment [controller] – Domain Controller – ONAP Controller

OTN PNF = "optical" domain = controller-z

OTN PNF w/ S/W load 1.1.1.2 = controller-X

OTN PNF w/ S/W load 1.1.1.3 = controller-y

Scale, US/Europe, W-E coast. REGIONAL

3. Vendor / External Controller

Question – who defines the "Domain". Defined by Service Provider.

Dynamic Association Approach

Design Time / Model Level

Tech Domain	NF (PNF/VNF)	ONAP Platform Controller	Function (API)
Wireless	E// 5G DU	SDN-C	SDN-C Generic API
Wireless	Nokia 5G DU	SDN-C	SDN-C Generic API
Wireless	Huawei 5G DU	SDN-C	SDN-C Generic API
Wireless (Vendor xyz)	Xyz 5G DU	SDN-C	SDN-C
Wireless Subdomain 1	Xyz 5G DU	VF-C	VF-C
Wireline	Wireline PNF	APP-C	APP-C Assign > APP-C Modify Config Restart Stop/Start
Optical	OTN PNF#2	SDN-C	SDN-C

SO Recipe different controller per flow

Lifecycle Management vs CM

SSH key to NF to authenticate controller

Data structure/Platform-Application Data

Mechanism that SP to configure for their operation

Choose to have APP-C vs SDN-C to do something

Controllers configured to handle domain & function

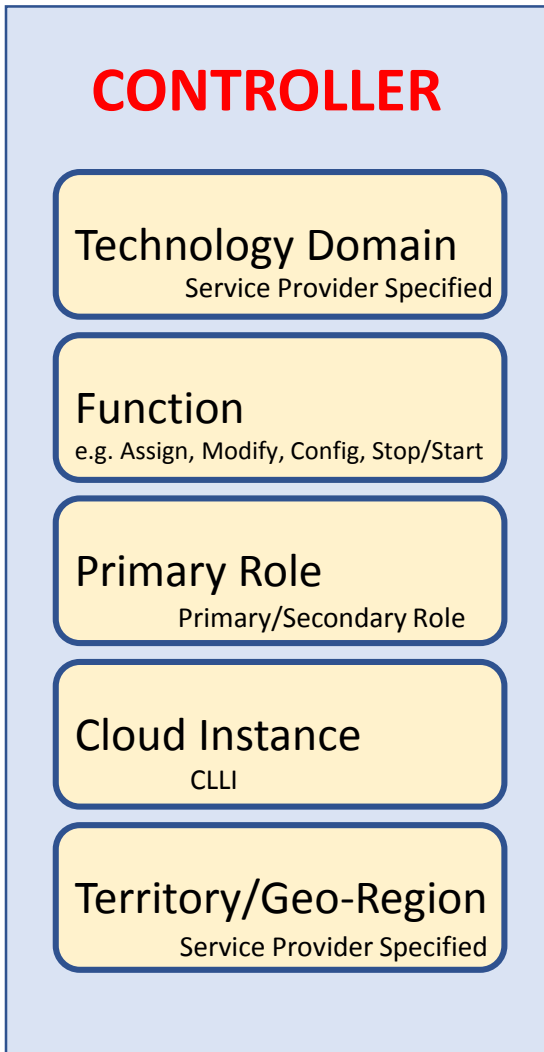

Controllers could publish to the table

Controller register to give provide input for auto-population

Controller when created can state its capabilities

Dynamic Association Approach

CONTROLLER REGISTERS IS ABILITIES

In Run-time the controller can “register” with the *Dynamic Association Handler* which would specify its capabilities

Controller created specifies its abilities.

When you onboard a controller It should self-identify the capabilities It supports. SDNC might support modify config doesn't support stop/start LCM.

SO Work-flows. Not only at controller level but at different level (resource level).

SAS – A service comes up, dependencies / capabilities. Based on capabilities resolve dependencies & corresponding API used. PNP “on the fly” addition. 3rd party controller. OSDF/SAS Technology based.

Registry w/ Table-metaphor is dynamic. Do controller stuff in controllers. Bootup time register controller. Possible to Re-run registry (during runtime). Register/ Re-Register/ Deregister.

Table should be outside of SO or in Consul. E.g. Healthcheck where SO is not involved. Anyone should be able to do a look-up. CC-SDK.

RUN TIME CATALOG (SDC created artifacts) vs CONSUL (Southbound of ONAP controller & capabilities)

VNF is a collection of VFCs. VNF one API endpoint. All VFCs are within same cloud instance. A service can be composed of VNFs from multiple vendors or the same.

Dynamic Association Approach

PNF Plug and Play VNF Instantiation

A NF is a VNF or PNF that can interact with a Controller.

Corner Case: VNF w/ multiple VNF-Cs spanning multiple regions.

Service provider defines “Major” technology domains (e.g. Wireless), the Vendor can define “Minor” technology domain (e.g. 5G RAN)

“Lookup” we have a NF ... and its part of this xyz Domain.

DU in SDC (Model)

DU in A&AI (Instance)

SO looks up what controller should be used?

DU says “I’m in this tech domain”

Tech domain are “main lookup key”

Function are supporting attributes

SO would know the Cloud Region, Territory.

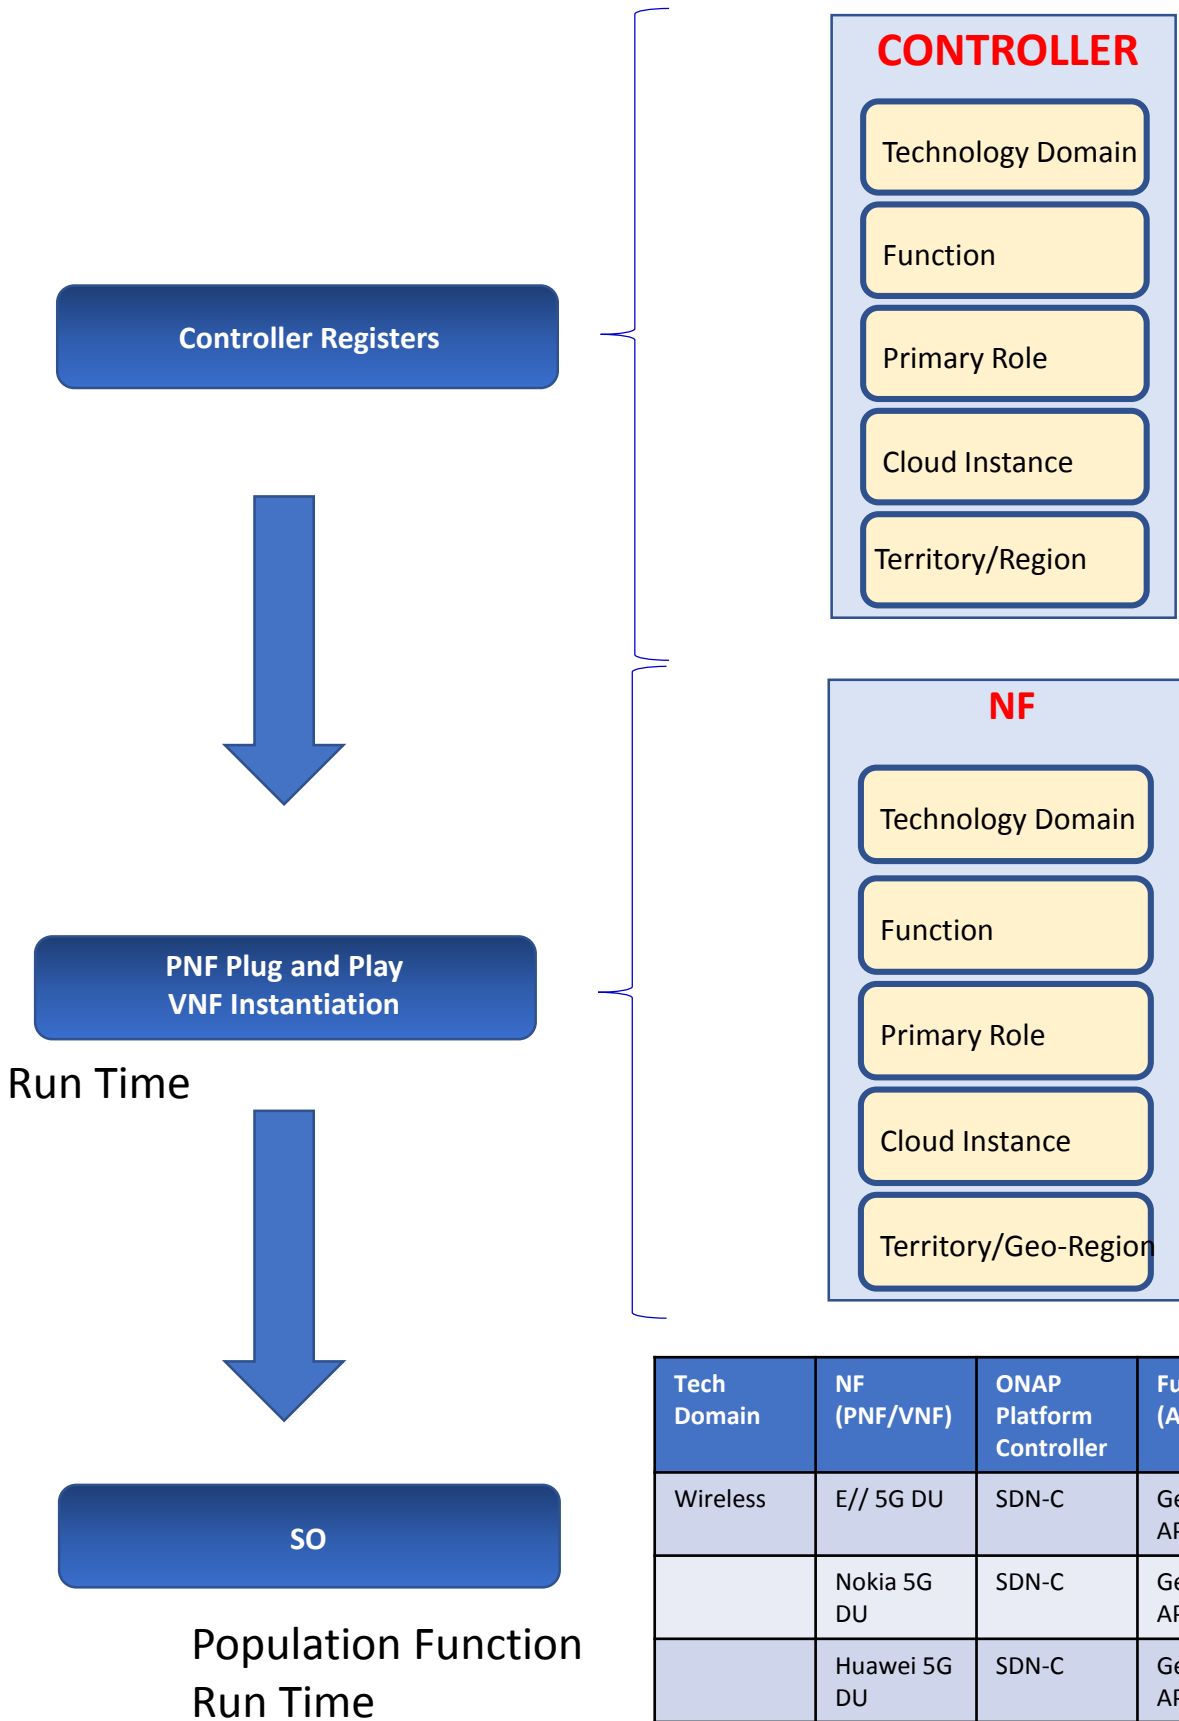

When it comes time to call a controller.

Via Homing & Complex-Object

QUERY into the “Table” returns Tech domain-
Function – Primary – Cloud –Georegion

SDC, VID, OOF, A&AI dependencies.

Dynamic Association Flow

Dynamic Association – Design Time

SDC

STEP 1:

INSTANTIATE CONTROLLER (Design Time)

1a. VNF SDK describe attribute functionalities needed within the TOSCA model those capabilities are mapped into a controller based on the table.

1a. In the ONAP build, Empty Table is Created.

1a. SP provisioning/setup of ONAP instance/installation. i.e. SO, SDN-C, APP-C configuration

1b. SP Create instances of Controller

1c. Profile Controller (tech fun role instance)

1d. Filling in the Controller part of Table.

STEP 2:

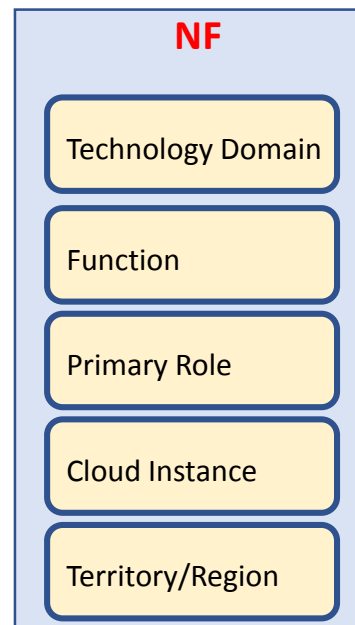

NF MODEL (Design Time)

NF Model ingestion/onboarding

NF part of table updated (Vendor Class of NF)

CSAR > VNF SDK

Tech Domain	NF (PNF/VNF)	ONAP Platform Controller	Function (API)
Wireless	E// 5G DU	SDN-C	Generic API
Wireless	Nokia 5G DU	SDN-C	Generic API
	Huawei 5G DU	SDN-C	Generic API
Wireless	Xyz 5G DU	SDN-C	SDN-C

NF PACKAGE

CSAR file

STEP 1:

INSTANTIATE CONTROLLER (ONAP Installation)

WHO: Capacity/Network Planning Team (Service Provider), ONAP Installation Team (Service Provider)

1a. The Table is Created with no value (Empty)

1b. SP provisioning/setup of ONAP instance/installation. i.e. SO, SDN-C, APP-C configuration

1c. SP Create instances of ONAP Platforms Controller (SDN-C, APP-C, VF-C)

1d. Onboard Profile Controller (tech fun role cloud instance loc)

1e. Filling in the Controller part of Table.

CONTROLLER
Technology Domain
Function
Primary Role
Cloud Instance
Territory/Region

STEP 2 (DESIGN TIME ACTIVITIES)

WHO:

SDC Design Studio, CDT, DCAE-DS ... etc

1a. Input to SDC TOSCA template from VNF-SDK (or manual) that specifies what the NF needs from a controller and NF properties

1b. Onboarding PNF-D, Defining Models & Artifacts, Updating SDC Catalog

1c. NF information put into the SDC artifacts/CSAR Package

1d. (optional) SDC could also update the Controller section of the table (by specifying controller information). Tool/Script to controller information if necessary (due to typos, adaptations for congestion, migrations, new technology domains, etc).

1e. SDC distributes Artifacts (CSAR) to ONAP components & listeners

1f. Process of ingesting the model (SDC artifacts), SO populates the table (NF part of the table "new", UPDATES the rest of the table from Optional updates [in step 1d.]).

NF
Technology Domain
Function
Primary Role
Cloud Instance
Territory/Geo-Region

STEP 3: (RUN TIME OPERATION)

1a. Components in ONAP (e.g. SO, policy) USE the table to find the appropriate controller & APIs for a NF.

1b. When policy's action require a controller look at the table.

When policy's action is to consult w/ SO it knows how to talk to SO
EXAMPLE: Message from NF, executing a Use Case. e.g. Threshold > NF > DCAE > Policy > Action > SO: Controller to interact w/ NF

DISCUSSION

NOTE: Once initial instantiation takes place & mapping, that mapping needs to be maintained for the lifecycle of the NF.

Q: Stability of Table? Will answers change?

A: For same data in will get same answer out.

A: Updates to the table can be made

Q: (Ben) case: conflict race condition (operator#1 updating / operator#2 updating table).

A: Transaction control

ONAP installation team updates. Should own data integrity of the table.

Maria DB transaction control.

Q: (Oskar) case: granularity of look-up, look-up based on a specific action.

Restart but can't do config modify.

For a particular instance of NF handled by one controller instances.

Cases w/ dynamic look-up hard to guarantee.

If you have granularity on operation-level get two answers depending on which operation you want to perform.

Locking in A&AI to block other things.

Operations lock out ONAP from doing changes while maintenance

Course locking/ Finer locking (future)

NF#12 two active Policies

Policy #1 Restart Policy #2 Config-Modify. Trigger at same time.

Table lookup > Get Controller Instances.

NF Controller PROPOSALS (Goal)

DESIGN-TIME

SDC – Design Studio

Onboard a resource (type, role, function, [tech domain])

Deduce tech domain? From type-role-function?

Operator specifies the Technology Domain of the NF

Operator specified the Technology domains

(or possibly Techdomain is deduced from type-role-function)

Service Provider defines the possible Technology Domains

Assign every NE and Service to a Technology Domain

TD1 = SDN-C TD2 = VF-C manually modeled, table created.

TechDomain to ONAPPlatformController

SDC – Model “mapping” > Catalog

RUN-TIME

As a NF registers, the (managing ONAP entity e.g. SO for PNF) would look up the TD > OPC mapping)

3 Technology Controllers (Wireless, Enterprise, Other)

When generate controller it populates the table.

Dynamically populate table

Who Chooses the Controller?

Who Choose the ONAP controller type for the NF?

NF Controller - Notes

Identifying the NF controller

For VNF is part of the Call Flow

VNF gets orchestrated through recipe & DG & Yang models
(assumption is SDNC is the controller)

VNF can have own domain controller

DG pass control VN adaptor to 3rd party controller

PNF controller to be discovered as part of the PnP Flow

Provision PNF manually specify the Controller

SO passes to APPC service instance

SO pulls service info

PNF (CU) must be configured first

CU configuration process (could identify the ONAP controller)

PNF (routers, access pts, RAN 5G DU, CU)

- SDN-C, VF-C, x-controllers
- ONAP SO needs to know what API & Controller for PNF.
-

NF Controller - Notes

NOTES: July 17th Modeling Discussion

Seshu

We have talking of a TOSCA event-based flavor given

To the WF entity-based;

SO Trying to adapt – The NF controller modeled-

User on client side selects the controller (also has problems)

If not the UI, the modeler who can understand this is the case

Information that something is a missing point – trying to

Can we have a understanding in des-time; for the controller

SDN-C, APP-C, VF-C, GNF-C etc

Resources compatible w/ this resource type

A designer driven

Designer may not know

PNF PNP does not use OOF

This is a RECURRENT problem (also encountered in Scaling use case)

Alex Vul

PLACEMENT POLICY – POLICY FRAMEWORK

Design times generic, bind specific VNF

Map to OOF.

Mechanism exists.

Log des; phys infrastructure; binding between 2 (by OOF)

Heirarchical orchestration

Policy design by a Human Operator, designs the policy of PNF.

Designer doesn't know controller;

Chaker AlHakim

Restate the problem

Add an attribute in A&AI

Register a SERVICE. Add service in A&AI.

Best way to register the service controller is providing.

Creating the service don't know physical/virtual resources.

Srini Vellanki

Workflow designer

SERVICE MODEL – which controller to use

A&AI (Reference)

- ONAP and PNF Plug and Play for 5G RAN
- 5G Use Case Team

ACTIVE INVENTORY (A&AI) R3/Casa

ACTIVE & AVAILABLE INVENTORY (A&AI) PROJECT IMPACTS

New A&AI PNF Parameters

~~PNF GEOLOCATION~~ - geographical location (e.g. coordinates or address of the building, etc.). Latitude/Longitude. **THIS ALREADY EXISTS VIA ASSOCIATION TO THE "COMPLEX" OBJECT.** The Complex Object represents a BUILDING or location with geographical information. The AAI PNF will have a UML association to the Complex object.

Software Version

DETECTED SOFTWARE PNF VERSION(S) – swVersionList.

R3 Casablanca – This will be a list of software versions. In Run-Time when PNF registers with ONAP it can report its (list) of PNF Software that is currently has installed. This will be tracked in A&AI entry for that PNF. Entry will also an indication that one is *Active*.

R4 Dublin – proposing software Object which could be linked by SDC and A&AI.

swVersion [1...x] (Array)

```
{  
    swVersion (String)  
    activeSw (Boolean)  
}
```

Homing

PNF [#1:CU/#2:ONAP] CLOUD HOME (CLOUD SERVER LOCATION) – PNF is served by some regional ONAP cloud servers. Serves in “Rehome” PNF. **CLLI Code** (specifies location, street address, **CloudID**, physical server is deployed). [Potentially a list of locations]

OOF determine the homing of a NF. Anything you home is determined in the context of a deployment. (Homing) Policy used as a f(service). Data center might have been divided into cloud regions. Service VMME running in NE area (distances, regions, tenants where to instantiate PNF). AAI has **COMPLEX node**. “Physical Location ID” (8 char CLLI code, lat/long = geolocation info of data center. Cloud region doesn’t span data centers.

External Manager IP Address

External Manager IP Address – provides an additional IP address for the BTS that is vendor-specific and relevant to the OAM management of the BTS.

SUGGESTION (from Christina A&AI) model the NMS as a PNF itself (and the NMS will have parameters to represent itself; and then PNF can be associated with it).

S/W Image Repository / R3 Casa

ACTIVE & AVAILABLE INVENTORY (A&AI) PROJECT IMPACTS

**S/W Image
Repository**

S/W Image Repository – Where the S/W is located.
Configuration Parameter.

PNF A&AI Entry

PARAMETER	DESCRIPTION
PNF-NAME	<p><i>pnf-name</i> is the Key in AAI. <i>pnf-name</i> is the first three letters of the Vendor and PNF serial number. This is a unique identifier for the PNF instance. It is also called the Correlation ID.</p> <p>Note: MAC address & serial number are unique per vendors; not across vendors, so the Vendor name is added to insure uniqueness.</p>
EQUIP-TYPE	The <i>equip-type</i> parameter gives the type of the PNF.
EQUIP-VENDOR	The <i>equip-vendor</i> is an optional parameter which indicates the vendor for the PNF. For example, Nokia or Ericsson.
EQUIP-MODEL	The <i>equip-model</i> is an optional parameter which indicates the model of the PNF.
PNF-ID	UUID = Service provider assigned number from network planner.
MANAGER IP ADDRESS	adds <i>ipaddress-v4-oam</i> ; <i>ipaddress-v6-oam</i> This is the “manager IP Address” which for a DU might be a CU IP address; (FYI/ <i>ipaddress-v4-loopback-0</i>).
MAC ADDRESS	This is the MAC address of the PNF. This is a service field.
SERIAL NUMBER	This is the serial number of the PNF. This is a service field.
PROXY IP ADDRESS	This field contains the <i>proxy IP address</i> for the PNF.

PNF Plug and Play ROADMAP (After Casablanca)

- ONAP and PNF Plug and Play for 5G RAN
- 5G Use Case Team

TOPIC: SWVERSIONLIST (R4+)

TOPIC:

Adding Description to software_versions (after Casablanca R4+)

Problem Statement: Adding Description to SWVersionList

Problem Statement: Add new **DATATYPE**

(going through the modeling subcommittee)

SOLUTION

• Content of PNF software version List

Contents		Description
softwareList	description	Describes the main feature of the this software version
	swVersion	Software version

Want a DATA STRUCTURE in the TOSCA MODEL for the NF Model

Discussion

New Data Type for modeling PNF Software Versions

Software (object)

FIELD	TYPE	DESCRIPTION
software-id	String	Index key for this object
swDescription	String	Descriptive text of the software
swVersion	String	The version of this software
swVendor	String	Vendor for this software

CSAR file

Need to define a common "template" that all vendors Provide dictionaries for. DCAE-DS responsible for reading these files. Closed Loop. Vendor describe alarms being sent. Definition what alarms correlated to (collecting, triggers). CLAMP performs analysis, design of who uses it is SDC. Holmes monitoring micro-services (to receive alarms).

Communication STANDARDS we want to support?
[Data Format]

PNF Alarm #22
#22 S/W problem xyz
VES = fault fields; "fault" domain publish DMaaP
Clamp, Analytic, Holmes – [#22 event]
Dictionary looks up #22 ->

YAML NF REGISTRATION (R4 DUBLIN)

EVENT DEFS

Events

YAML Definitions

(pnfRegistration, HVVes)

YAML Registration – All events a NF supports
Indicates how this NF send the data for that event

ACTION: (Sept 25) What is done w/ a VNF now? for VNF YAML Registration. Architecture Team (Chris Donley, Steve Terrill, Brian Freeman)

DCAE is consuming Artifacts / Registration YAML

1. Map to Meta-data connected to Service to be instantiated for
2. **ACTION**: DCAE to connect between service & file. What DCAE component will read this information. Who is consuming the information. SERVICE CHANGE HANDLER is the DCAE “LISTENER” of SDC. Anyone can consume the SDC notifications.
3. Do they expect same format?
4. **ACTION**: Does SDC need to do Modifications or processing? [FM] no additional mapping [PM]. Does DCAE-DS or DCAE need any modification to consume the data.
5. **SUBSCRIBING** - Subscribing to information. (1) new ARTIFACT TYPE can subscribe to that new type, DCAE makes new service, knows to download the new type, (2) all is packaged in the CSAR package.
6. **ARTIFACT TYPE**: Application that receives the artifact needs to know what it is. Will DCAE try one way to read, or another. *QUESTION do we need a new Artifact Type or can we reuse the DCAE_TOSCA, DCAE_JSON.*

FM / YAML / Definition for Alarm003 (“Record”)

```
# registration for Fault_vMrf_alarm003
# Constants: the values of domain, eventName, priority, v1status
# , version, alarmCondition, eventSeverity, eventSourceType,
# faultFieldsVersion, specificProblem,
# Variables (to be supplied at runtime) include: eventId, lastEpochMicrosec,
# reportingEntityId, reportingEntityName, sequence, sourceId, sourceName,
# startEpochMicrosec
event: {presence: required, action: [ any, any, alarm003, RECO-rebuildvnf ],
structure: {
commonEventHeader: {presence: required, structure: {
domain: {presence: required, value: fault},
eventName: {presence: required, value: Fault_Vmrf-Nokia_Alarm003},
eventId: {presence: required},
nfNamingCode: {value: mrf},
priority: {presence: required, value: Medium},
reportingEntityId: {presence: required},
reportingEntityName: {presence: required},
sequence: {presence: required},
sourceId: {presence: required},
sourceName: {presence: required},
startEpochMicrosec: {presence: required},
lastEpochMicrosec: {presence: required},
timeZoneOffset: {presence: required},
version: {presence: required, value: 3.0}
}},
faultFields: {presence: required, structure: {
alarmCondition: {presence: required, value: alarm003},
eventSeverity: {presence: required, value: MAJOR},
eventSourceType: {presence: required, value: virtualNetworkFunction},
faultFieldsVersion: {presence: required, value: 3.0},
specificProblem: {presence: required, value: "Configuration file was corrupt or
not present"},
v1Status: {presence: required, value: "Requesting Termination"}
}}
}}
}}
```

YAML REGISTRATION FILE (FM, Heartbeating, Meas, Syslog, Mobile Flow, Sip Signaling, etc)

Separate Registration event PER “NF type” (E//, Nokia, Huawei etc) each PNF has separate presentation onboarded PNF. Building block used in different services.

CONSUMERS: DCAE, Analytics Applications (?), Custom Plug-ins

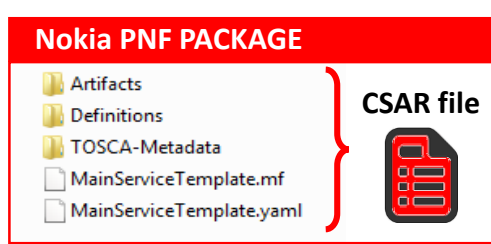

-  Fault records
-  Heartbeat records
-  Measurement records
-  Mobile Flow Records
-  PnfReg records
-  SipSignaling records
-  State Change Records
-  SysLog records
-  TCA records
-  Voice Quality records
-  Other records

- ‘Fault’ for the fault domain
- ‘Heartbeat’ for the heartbeat domain
- ‘Measurement’ for the measurements domain
- ‘MobileFlow’ for the mobileFlow domain
- ‘Other’ for the other domain
- ‘PnfReg’ for the pnfRegistration domain
- ‘SipSignaling’ for the sipSignaling domain
- ‘StateChange’ for the stateChange domain
- ‘Syslog’ for the syslog domain
- ‘Tca’ for the thresholdCrossingAlert domain
- ‘VoiceQuality’ for the voiceQuality domain

1. NORMALIZE – different definition for different
2. DCAE-DS – could be used to modify the YAML

YAML REGISTRATION FILE
Nokia PNF

YAML REGISTRATION FILE
E// PNF

YAML REGISTRATION FILE
Huawei PNF

YAML REGISTRATION FILE
Nokia VNF

YAML REGISTRATION FILE
E// VNF

YAML REGISTRATION FILE
Huawei VNF

I have PNF two different releases, in release 1 I may have a group of items In dictionary, in release 2 can I provide different one.

PNF Type	Release 1 (S/W version)	Release 2 (S/W version)
E// PNF – FM	FM “records” (YAML registration file) YAMLregfile-E//Rel1	FM “records” (YAML registration file) YAMLregfile-E//Rel2
E// PNF – PM	PM “records” (YAML registration file) YAMLregfile-E//Rel1	PM “records” (YAML registration file) YAMLregfile-E//Rel2
Nokia PNF – FM	FM “records” (YAML registration file) YAMLregfile-NokiaRel1	FM “records” (YAML registration file) YAMLregfile-NokiaRel1
Nokia PNF - PM	PM “records” (YAML registration file) YAMLregfile-NokiaRel1	PM “records” (YAML registration file) YAMLregfile-NokiaRel1

If just one alarm or one PM changed, could you provide the single “record” or the entire file again?

SDC Artifacts Type

<https://wiki.onap.org/display/DW/SDC+supported+artifact+types>

Artifact Type	Description	Valid on Component Types
HEAT	HEAT Base template (yaml format). Provided by vendor during on-boarding	VF
HEAT_VOL	HEAT template defining required volumes (yaml format). Provided by vendor during on-boarding	VF
HEAT_NET	HEAT template defining required networks (yaml format). Provided by vendor during on-boarding (deprecated)	VF
HEAT_ENV	HEAT Environment artifact (yaml format, extension “.env”). This artifact is accompanied to HEAT template and containing values to subset of the template’s parameters. First version is provided by vendor, then SDC generates new content according to designer changes	VF / VF instance
HEAT_ARTIFACT	Supplementary artifact referenced in HEAT* template (“get_file”). Provided by vendor during on-boarding	VF
HEAT_NESTED	HEAT file referenced from another HEAT file (yaml format). Provided by vendor during on-boarding	VF
YANG_XML	YANG asset based XML	Service / VF / VFC
VNF_CATALOG	YANG asset based XML	Service / VF / VFC
MODEL_INVENTORY_PROFILE	Inventory Asset (XML format). As from 1610 it is generated by SDC during service certification	Service / VF / VFC
MODEL_INVENTORY_PROFILE	Inventory Asset Named Query Specification (XML format)	Service / VF / VFC
VF_LICENSE	VF License Artifact (XML format). Created during on-boarding of the VF	VF
VENDOR_LICENSE	Vendor License Artifact (XML format). Created during on-boarding of the VF	VF
APPC_CONFIG	configuration artifact	VF
VF_MODULES_META_DATA	Json artifact that describes the vfModules of the resource. SDC generates this artifact for every VF instance during the service certification.	Component instance (e.g. VF in Service)
DCAE_TOSCA	TOSCA template used by DCAE (yaml format)	VF / VFCMT (= monitoring template)
DCAE_JSON	JSON description of the DCAE component / template	VF / VFCMT (= monitoring template)
PLAN	Workflow artifact type	Service / VF / VFC

Resource / Service Categories

<https://wiki.onap.org/pages/viewpage.action?pageId=38114398>

Searching in the SDC Catalog

Category	Sub Category
Network L2-3	LAN Connectors, WAN Connectors, Router, Gateway, Infrastructure
Network L4+	Common Network Resources
Application L4+	Border Element, Database, Application Server, Web Server, Call Control, Media Servers, Load Balancer, Firewall
Generic	Infrastructure, Database, Abstract, Rules, Network Elements
Network Connectivity	Connection Points, Virtual Links
DCAE Component	Analytics, Policy, Utility, Collector, Source, Microservice, Database
Template	Monitoring Template
Allotted Resource	Tunnel XConnect, IP Mux Demux, Allotted Resource, Security Zone, Contrail Route, Service Admin

VES On-Boarding Artifact Use

SDC VES-Onboarding Artifact

All Domains Supported including Optional Fields

- heartbeat – default heartbeat interval
- fault – all possible faults with recommended action
- Measurement (KPI/KCI) – with recommended TCAs
- Syslogs Tags with recommended actions

Policy Creation Framework Design, Closed Loop Design Creation

Info to DCAE Components

- Event Validation e.g. Domains/Fields supported
- Rough Policies based Vendor Recom. Actions
- Mapping Info or Logic needed by Micro-services
- CLAMP Flows for Closed Loop and Open Loop

VNFC Instantiation/VFC Life Cycle

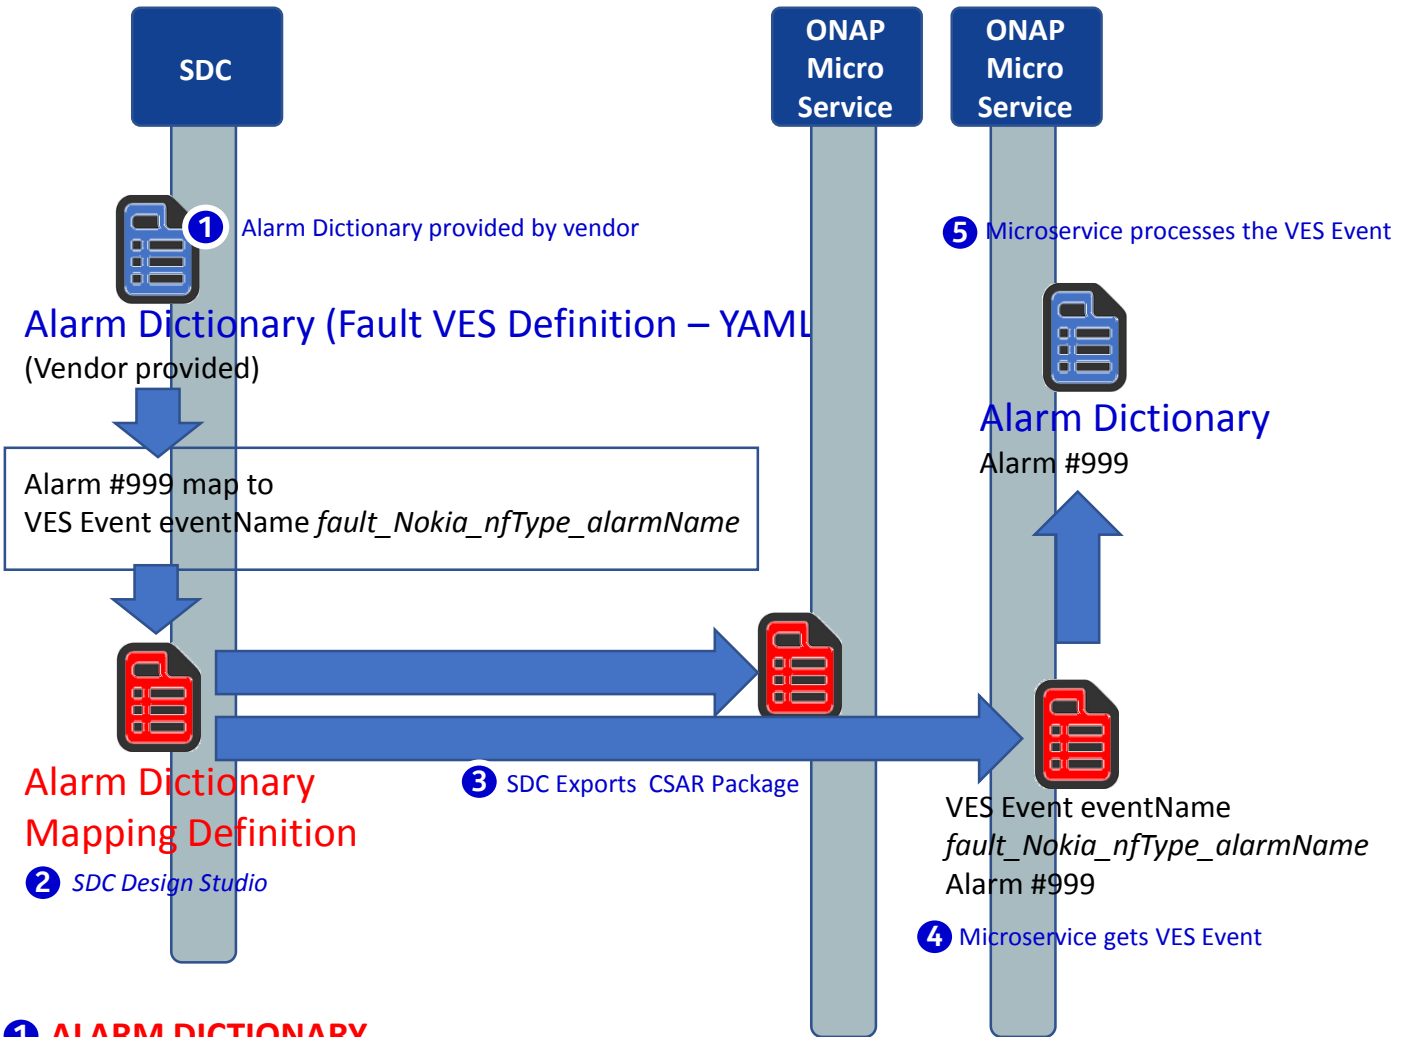

- User Name/Password
- FQDN
- Configurable Parameters
 - Heartbeat Interval
 - Measurement Interval
 - Configurable Domain Data

Other Portals

- OPs Portal – Electronic M&Ps
- P&E Portal – Capacity Planning Data

Alarm Dictionary Usage

1 ALARM DICTIONARY

Alarm Dictionary defines all alarms/faults published by xNF (x=V or P)
Based on 3GPP TS32.111, ETSI, and VES document (v6.0)

2 SDC DESIGN STUDIO MAPS VES FAULT Event to Alarm Dictionary

SDC Design studio does mapping of Alarm dictionary entries to VES Fault Events to produce a “mapping” definition in the CSAR package. (RATHER than mS doing the mapping because it is more model driven)

3 SDC DISTRIBUTES DEFINITIONS

SDC creates a definition of how to start-up service. SDC exports the *CSAR package* with the VES Fault to Alarm dictionary mapping definitions.

DEFINITIONS & ARTIFACTS (CSAR PACKAGE)

1. VES-Alarm mapping definition passed by SDC (CSAR Package) to ONAP components
2. DCAE micro-service gets CSAR package

4 MICRO SERVICE GETS FAULT EVENT

Microservice has subscribed to fault domain DMaaP Topic and receives the VES Fault Event from xNF in run-time.

5 MICRO SERVICE PROCESSES EVENT

Microservice processes the VES Event using the Alarm Dictionary

Alarm Dictionary Usage

ALARM DICTIONARY (Fault YAML File) PURPOSE

- (1) DICTIONARY** - it allows for a readily accessible body of the entire set of alarms & faults that are managed by a PNF. It would allow for an operator to see all of the alarms & faults of a PNF without having to wait for individual alarms & faults to arrive in ONAP.
- (2) Analytics facilitator** – A dictionary would allow for a variety of vendor specific (or vendor agnostic) analytics applications to be developed. There are a variety of fields in the Alarm Dictionary that would facilitate such analytics capabilities as correlation, escalation, isolation, recovery actions, self-healing, and life cycle management functions.
- (3) GENERAL ANALYTICS** – The strength of ONAP is the potential ability to coordinate information from multiple sources, different vendors, and disparate types of NFs. A dictionary can form the foundation for generalized analytics that are vendor agnostic.

FAULT DICTIONARY PURPOSE

- (1) FAULTS vs ALARMS** - Fault can be a condition encountered in run-time that does not necessarily create a customer-facing alarm. An alarm is intended to result in a visual notification to a service provider to take action. An analogy would be the “Check engine” light in your car which would correspond to an Alarm. A solenoid, a carburetor, or distributor fault all might lead to a “Check engine” light. A driver (service provider) may not be able to directly act on the specific fault (or indeed care about the fault); but when the “check engine” light went on would know to take some action (go to the service station). FRTire-Fault FLTire-Fault RRTire-Fault RLTire-Fault -> TIRE LOW TIRE PRESSURE Alarm

NF ALARM DICTIONARY FIELDS (Template)

ALARM FIELD	DESCRIPTION
Alarm Dictionary Index	<p>Gives the Identifier for the alarm. This is also the Identifier that is used in the VES event so it can be used to associate the event with the definition entry.</p> <p>The VES Event <i>EventID</i> would encode the Alarm number which will correspond to the Alarm Index.</p> <p>EXAMPLE: 12345</p>
Alarm Name	<p>Alarm Name which will be used in the Event Name. Note <i>this maps to the alarmCondition in the VES Fault Event in faultevent fields.</i></p> <p>EXAMPLE: Synchronization Lost</p>
Event Type *	<p>Indicates the type of alarm. The types are: Communications Alarm, Processing Error Alarm, Environmental Alarm, Quality of Service Alarm, Equipment Alarm, Integrity Violation, Operational Violation, Physical Violation, Security Service Violation, Mechanism Violation, or Time Domain Violation. Note <i>this maps to the eventCategory in the VES Fault Event in faultevent fields.</i></p> <p>EXAMPLE: Quality of Service Alarm</p>
Meaning of Alarm	<p>Provides a descriptive meaning of the alarm condition. This is intended to be read by an operator to give an idea of what happened.</p> <p>EXAMPLE: Synchronization has been lost</p>
Effect of Alarm	<p>Provides a description of the consequence of the alarm condition. When this alarm condition occurs. This is intended to be read by an operator to give a sense of the effects, consequences, and other impacted areas of the system.</p> <p>EXAMPLE: Loss in Quality of Service</p>
Managed Object(s)	<p>Managed object (MO) associated with this Alarm. Note <i>this maps to the eventSourceType in the VES Fault Event in faultevent fields.</i></p> <p>EXAMPLE: Clock (MO)</p>
Probable Cause *	<p>Provides the probable cause qualifier for the alarm. Probable causes are found in 3GPP TS 32.111 Annex B drawn from ITU-T M.3100 and from ITU-T Recommendation X.721, X.733, and X.736</p> <p>EXAMPLE: lossOfSynchronisation</p>
Probable Cause Number*	<p>Probable Cause Number the numeric value associated with the Probable Cause</p> <p>EXAMPLE: 76</p>
Specific Problem *	<p>(Optional) It provides further qualification on the alarm than probable Cause. This attribute value shall be single-value and of simple type such as integer or string. Defined in ITU-T Recommendation X.733 Clause 8.1.2.2. Note <i>this is the 3GPP Specific problem not be confused with the specificProblem field of the VES Fault Event in faultevent fields.</i></p>
Proposed Repair Actions*	<p>It indicates instructions for proposed repair actions. These are defined in ITU-T Recommendation X.733 clause 8.1.2.12.</p> <p>EXAMPLE: Reset the BTS, ONAP Controller does x</p>
Clearing Type	<p>Indicates whether the alarm is automatically or manually cleared</p> <p>EXAMPLE: Automatic</p>
Additional Text*	<p>This field contain further information on the alarm. This attribute provides <i>vendor specific</i> alarm information. A specific condition for this optional population is when an alarm presented by the EM has different values of perceived severity, and / or alarm type.</p> <p>EXAMPLE: Specific data 10</p>
Associated Fault(s)	<p>Indicates the associated faults that triggered this alarm. List of fault(s) associated with the alarm cross indexed against a vendor provided fault information.</p> <p>EXAMPLE: Fault 99999</p>

*3GPP TS32.111

NF FAULT DICTIONARY FIELDS (Template)

DEFINITION FIELD	DESCRIPTION
Fault Id	Gives the Identifier for the alarm. This is also the Identifier that is used in the VES event so it can be used to associate the event with the definition entry. EXAMPLE: 99999
Fault Name	Alarm Name which will be used in the Event Name. Note <i>this maps to the alarmCondition in the VES Fault Event in faultevent fields.</i> EXAMPLE: Loss of Synchronization
Fault Description	Provides a descriptive meaning of the alarm condition. This is intended to be read by an operator to give an idea of what happened. EXAMPLE: Synchronization due to PTP IEEE1588 Failure
Managed Object(s)	Managed object (MO) associated with this Alarm. Note <i>this maps to the eventSourceType in the VES Fault Event in faultevent fields.</i> EXAMPLE: Clock (MO)
Effect of Fault	Provides a description of the consequence of the alarm condition. When this alarm condition occurs. This is intended to be read by an operator to give a sense of the effects, consequences, and other impacted areas of the system. EXAMPLE: Loss of synchronization affect QoS
Associated Alarm(s)	Indicates the associated faults that triggered this alarm. List of fault(s) associated with the alarm cross indexed against a vendor provided fault information. EXAMPLE: 12345
Proposed Repair Actions	It indicates instructions for proposed repair actions. These are defined in ITU-T Recommendation X.733 clause 8.1.2.12. EXAMPLE: Reset BTS
Additional Text	This field contain further information on the alarm. This attribute provides <i>vendor specific</i> additional fault information.

"

PM Dictionary Usage

1 PM DICTIONARY

PM Dictionary defines all measurements published by xNF (x=V or P)
Based on 3GPP TS32.503, ETSI, and VES document (v6.0) [has Cloud scaling counters]

2 SDC DESIGN STUDIO MAPS VES FAULT Event to PM Dictionary

SDC Design studio does mapping of PM dictionary entries to VES Fault Events to produce a "mapping" definition in the CSAR package.

3 SDC DISTRIBUTES DEFINITIONS

SDC creates a definition of how to start-up service. SDC exports the *CSAR package* with the VES Fault to PM dictionary mapping definitions.

DEFINITIONS & ARTIFACTS (CSAR PACKAGE)

1. VES meas mapping definition passed by SDC (CSAR Package) to ONAP components
2. DCAE micro-service gets CSAR package

4 MICRO SERVICE GETS MEASUREMENT EVENT

Microservice has subscribed to fault domain DMaaP Topic and receives the VES Fault Event from xNF in run-time.

5 MICRO SERVICE PROCESSES EVENT

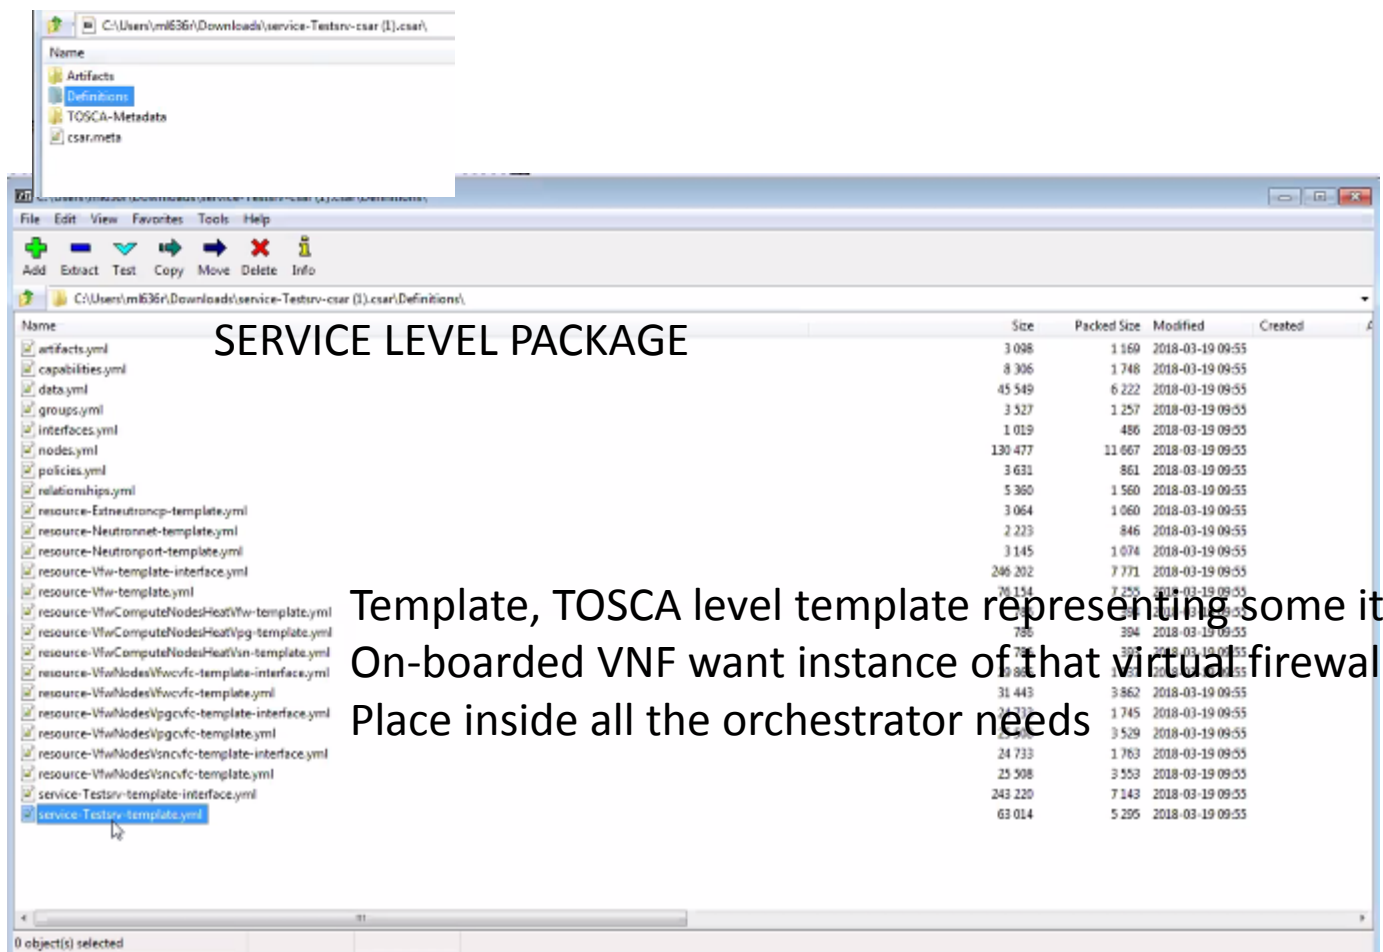

Microservice processes the VES Event using the PM Measurements Dictionary

The screenshot displays the ONAP Service Orchestrator interface. At the top, the logo for OPEN DAYLIGHT and ONAP are visible, along with the text 'Service Orchestrator' and a 'Logout (admin)' link. The main content area is titled 'Design Phase' and 'Create PNF via SO in A&AI'. It features a form with the following fields:

- Name:** New-PNF
- Identifier:** New-PNF network unique identifier
- Equipment type:** Fancy equipment type
- Equipment model:** Best in class
- Equipment vendor:** ONAP SDN-R Community
- IPv4 address:** 10.10.10.10

A blue button labeled '+ Create PNF in Active and Available Inventory' is positioned below the form. At the bottom of the interface, a footer reads: 'ONAP SDN-R | ONF Wireless for OpenDaylight Carbon-SR1 - Build: 2018-06-18 13:43 UTC'. The top right corner shows system status: 'Nodes: 1 | Alarm status: 4 | 0 | 0 | 2 | Sum: 6 | Help'.

SDN-R in Open Daylight create a A&AI PNF entry

software_versions (SDC Demo)

Demo given by Michael Lando (Aug 21, 2018)

Demonstrating software_versions in SDC Design Studio

software_versions (SDC Demo)

The dashboard features a top navigation bar with 'HOME', 'CATALOG', 'ONBOARD', 'DCAE-DS', and 'WORKFLOW'. A search bar is located in the top right. The main area contains a grid of service version cards. On the left, there are 'ADD' and 'IMPORT' buttons. The cards are organized into two rows. The top row contains five cards with status 'S' (Waiting For Distribution or In Design Check Out). The bottom row contains five cards with status 'R' (Certified or In Design Check In). Each card displays a unique ID, version number, and status.

ID	Version	Status
CIService1e7a73a6893	V 1.0	Waiting For Distribution
CIService182e812e6eb9	V 1.0	Waiting For Distribution
CIService758b1bcd7cc8	V 1.0	Waiting For Distribution

Management, General aspects

- Management services (MnS)
- Interface between MnS consumer and producer is standardized
- Operations and notifications for:
 - Provisioning;
 - Fault supervision;
 - Performance assurance.
- 5G Network Resource Models
- Performance measurements
- E2e KPI's
- Stage 3 Solution Set for HTTP/REST (OpenAPI)
- Stage 3 Yang specification for 5G NRM

O&M specification set

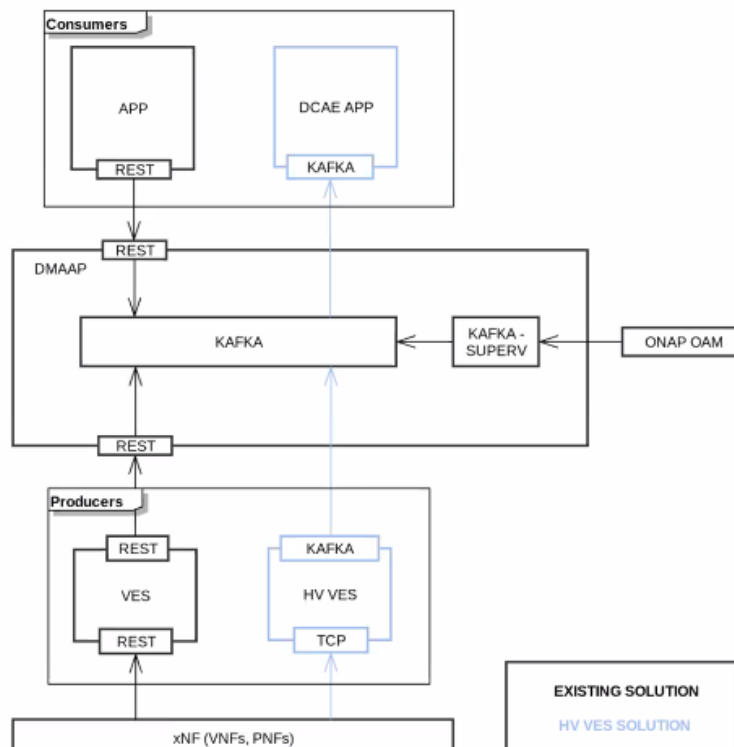

Work item	Specification number and title
Concepts, use cases requirements and architecture	TS 28.530 Management and orchestration; Concepts, use cases and requirements TS 28.533 Management and orchestration; Architecture framework
Generic specification	TS 28.532 Management and orchestration; Generic management services
Provisioning	TS 28.531 Management and orchestration; Provisioning
Fault supervision	TS 28.545 Management and orchestration; Fault supervision
Performance assurance	TS 28.550 Management and orchestration; Performance assurance
Assurance data and Performance Management	TS 28.552 Management and orchestration; 5G performance measurements and assurance data TS 28.554 Management and orchestration; 5G end to end Key Performance Indicators (KPI)
Network resource models	TS 28.540 Management and orchestration; 5G Network Resource Model (NRM); Stage 1 TS 28.541 Management and orchestration; 5G Network Resource Model (NRM); Stage 2 and stage 3

Network slice model

NOTE 1: The <<OpenModelClass>> NetworkService and <<OpenModelClass>> VNF are defined in [12].
 NOTE 2: The target Network Service (NS) instance represents a group of VNFs and PNFs that are supporting the source network slice subnet instance.

Rel-15 TS 28.541 Management & orchestration of 5G networks; NRM; stage 2 & stage 3.

Interface Types

R-XXXXX: The VNFD provided by VNF vendor may use the below described TOSCA interface types. An on-boarding entity (ONAP SDC) MUST support them.

tosca.interfaces.nfv.vnf.lifecycle.Nfv supports LCM operations

5.1.9. HPA Requirements

5.1.10. VES Requirements

CSAR provided by VNF vendor may include the ONAP proprietary extensions supported by SOL004 standard. The ONAP extensions should be registered in ETSI as specified in SOL004.

R-XXXXX: The CSAR extensions to support ONAP VES shall be described in both CSAR archive and manifest file as following:

- the CSAR includes:

!-----Lfnetworkingonap

!---- ves.yaml

- the manifest file includes:

non_mano_artifacts_sets:

!fn_onap:

Source: Lfnetworkingonap/ves.yaml

Note: The VES extension is not supported in Casablanca release
