

C&PS High Level Architecture Options

• Option A

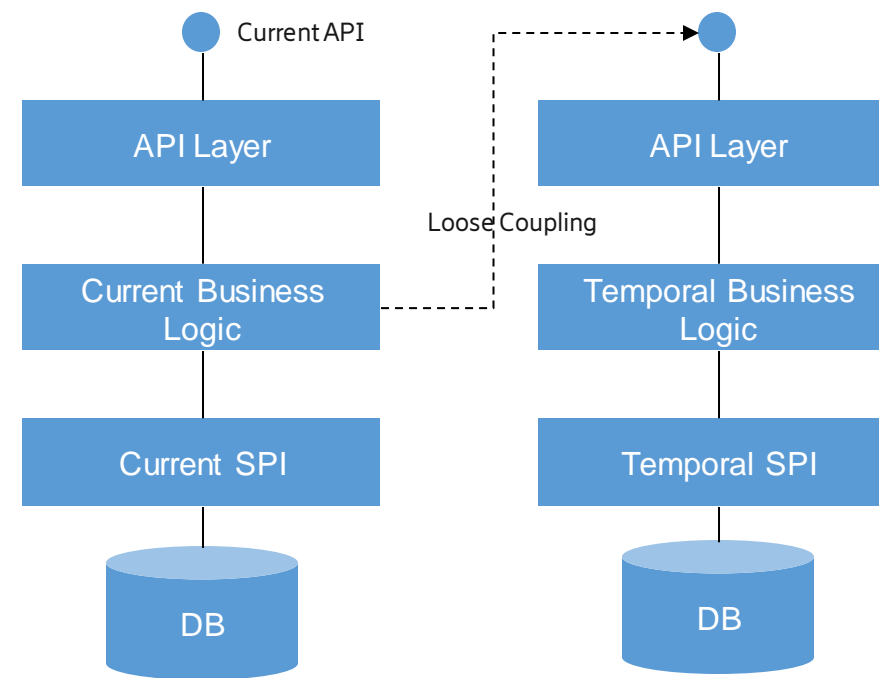

- Single SPI to support both temporal and current in a single DB
- Simple integration – single interface for current and historical querying
- Complex and sub-optimal design

• Option B

- Separate persistence technology optimised for the use cases – e.g. graph for current and time-series for temporal
- Combined business logic and API – single interface for current and historical querying
- Confusing API

• Option C

- Separate persistence technology optimised for the use cases – e.g. graph for current and time-series for temporal
- Clear separation of concerns
- Some use case might require access to 2 APIs
