124 **1List of Contributing Members**

125 The following members of the MEF participated in the development of this document and have
126 requested to be included in this list.

127 *Editor Note 1: This list will be finalized before Letter Ballot. Any member that comments in at*
128 *least one CfC is eligible to be included by opting in before the Letter Ballot is*
129 *initiated. Note it is the MEF member that is listed here (typically a company or*
130 *organization), not their individual representatives.*

- 131 •ABC Networks
- 132 •XYZ Communications

133 **2Abstract**

134 This document defines overall architecture for Cloud Services.
135

136

137 **3 Terminology and Abbreviations**

138 This section defines the terms used in this document. In many cases, the normative definitions to
 139 terms are found in other documents. In these cases, the third column is used to provide the refer-
 140 ence that is controlling, in other MEF or external documents.

141 In addition, terms defined in **MEF X [1]** are included in this document by reference, and are not
 142 repeated in the table below.

143

Term	Definition	Reference
CaaS	Communications as a Service	[2]
Cloud UNI	Cloud User Network Interface	In his document
Cloud ENNI	Cloud External Network Network Interface	In this document
cI	Cloud Interface	In this document
cP	Cloud Provider	[2]
cSUI	Cloud Service User Interface which is also called Cloud UNI	[2] and this document
cSO	Cloud Service Operator	[2]
cSP	Cloud Service Provider	[2]
cSOcSOI	Cloud Service Operator Cloud Service Operator Interface which is also called as Cloud ENNI	In this document
cC	Cloud Carrier	[2]
cSC	Cloud Service Connection	[2]
cSCEP	Cloud Service Connection End Point	[2] and this document
cSO-c	Cloud Service Operator Connection	[2] and this document
cSOCEP	Cloud Service Operator Connection End Point	[2] and this document
NaaS	Network as a Service	[2]
PaaS	Platform as a Service	[1,2]
SaaS	Software as a Service	[1,2]
SECaaS	Security as a Service	[2]
VM	Virtual Machine	[4]
VNF	Virtual Network Function	[4]

144

Table 1 – Terminology and Abbreviations

145

146

147 4 Compliance Levels

148 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
149 "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY",
150 and "OPTIONAL" in this document are to be interpreted as described in BCP 14 (RFC 2119
151 [15], RFC 8174[16]) when, and only when, they appear in all capitals, as shown here. All key
152 words must be in bold text.

153 Items that are **REQUIRED** (contain the words **MUST** or **MUST NOT**) are labeled as [R_x] for
154 required. Items that are **RECOMMENDED** (contain the words **SHOULD** or **SHOULD NOT**)
155 are labeled as [D_x] for desirable. Items that are **OPTIONAL** (contain the words **MAY** or **OP-**
156 **TIONAL**) are labeled as [O_x] for optional.

157 *Editor Note 2: The following paragraph will be deleted if no conditional requirements are*
158 *used in the document.*

159 A paragraph preceded by [CR_a]< specifies a conditional mandatory requirement that **MUST** be
160 followed if the condition(s) following the "<" have been met. For example, "[CR1]<[D38]" in-
161 dicates that Conditional Mandatory Requirement 1 must be followed if Desirable Requirement
162 38 has been met. A paragraph preceded by [CD_b]< specifies a Conditional Desirable Require-
163 ment that **SHOULD** be followed if the condition(s) following the "<" have been met. A para-
164 graph preceded by [CO_c]< specifies a Conditional Optional Requirement that **MAY** be followed
165 if the condition(s) following the "<" have been met.

166 5 Numerical Prefix Conventions

167 *Editor Note 3: This section will be deleted if no numerical prefixes are used in the document.*

168 This document uses the prefix notation to indicate multiplier values as shown in Table 2.

169

Decimal		Binary	
Symbol	Value	Symbol	Value
K	10 ³	Ki	2 ¹⁰
M	10 ⁶	Mi	2 ²⁰
G	10 ⁹	Gi	2 ³⁰
T	10 ¹²	Ti	2 ⁴⁰
P	10 ¹⁵	Pi	2 ⁵⁰
E	10 ¹⁸	Ei	2 ⁶⁰
Z	10 ²¹	Zi	2 ⁷⁰
Y	10 ²⁴	Yi	2 ⁸⁰

170

Table 2 – Numerical Prefix Conventions

171

172

173 6 Introduction

174 MEF developed an implementation agreement, MEF 47 [3], to address the Carrier Ethernet con-
175 nectivity to cloud applications. Later, Cloud Services Architecture was defined by OCC [2].

176 This specification builds on [2] and refines the architecture.

177 This specification describes overall architectural framework for MEF cloud services. Lifecycle
178 Services Orchestration (LSO) of Cloud Services are out of scope. They will be addressed in an-
179 other MEF spec.

180

181

182

183

184

185 **7 Use Cases for Cloud Services**186 **7.1 Access to Public Cloud Providers**

187 Applications provided by a Public Cloud Provider (cP) can be accessed via Internet as described
188 in Figure 1. Given Internet provides best effort service, we expect to see non-mission critical ap-
189 plications and applications that are less sensitive to network delay, jitter and loss are accessed
190 via Internet.

191 Wireless network and Internet combination is also an alternative for accessing applications pro-
192 vided by Public Cloud Providers.

193

194

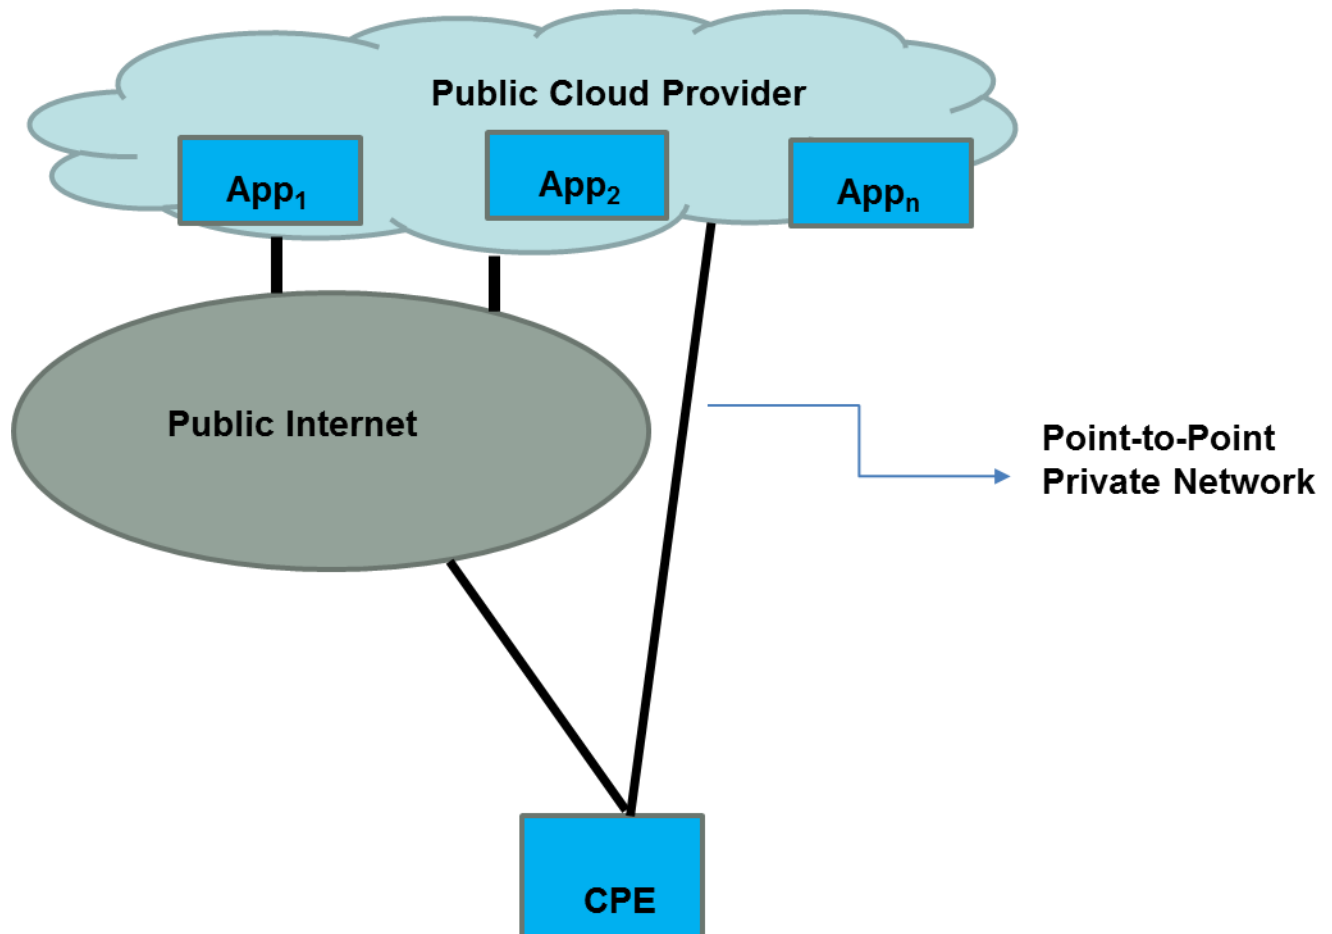

195 **Figure 1 – Public Cloud Provider Access via Internet**

196

197 Cloud service subscribers are very likely to use private networks to access mission critical appli-
198 cations and applications that are sensitive to network delay, jitter and loss, where Internet is used
199 as a back-up for connectivity as depicted in Figure 2.

200

201

202

203

204

Figure 2 – Public Cloud Provider Access via Private Network and Internet

205 Another use case for using Internet and Private Network for Public Cloud Provider access is de-
206 picted in Figure 3, where an employee of an enterprise may go thru the enterprise network first
207 and then access to the Public Cloud Provider or access the Public Cloud Provider directly via the
208 Internet. The interface between the enterprise and the Public Cloud Provider is expected to have
209 stricter security capabilities compared to the Public Cloud Provider's internet interface.

210 A branch office of an enterprise, that has no access to the enterprise's private network, may ac-
211 cesses to a virtual router provided by a public cP via Internet where the cP has a gateway to the
212 enterprise's private network providing connectivity to the enterprise's remaining branches.

IPVC: IP Virtual Connection

Figure 3 – Enterprise Employee Access to Public Cloud Provider

213

214

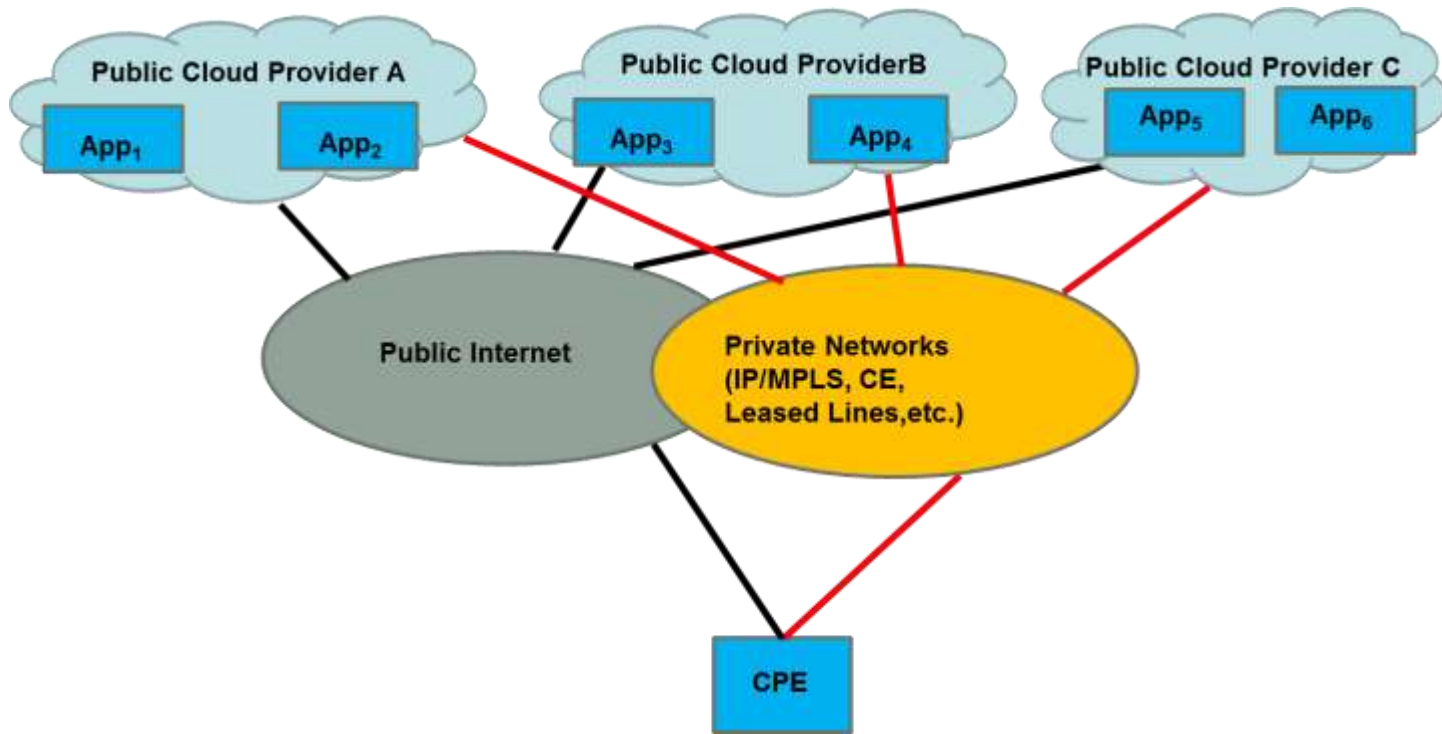

215

216

217

218 Via Internet, cloud users can access applications hosted by multiple cPs. The same access flexi-
219 bility is desired over private networks, as depicted in Figure 4.

234
235

Figure 4 – Public Cloud Provider Access via Private Network and Internet

7.2 Access to Private Cloud Providers

Cloud applications and connectivity to the applications can be provided by a single Operator. The Operator’s private network could be L1, L2, L3, wireless, overlay such as SD-WAN or their combinations. This is a common configuration for telecom service providers, as depicted in Figure 5.

Connectivity and applications can be provided by two different Operators as well.

236

237

238

Figure 5 – Private Cloud Provider Access via Private Network

239

240 7.3 Access to Combination of Private and Public Cloud Providers

241 A Private Cloud Provider (Actors of Cloud Services) may team up with a Public Cloud Provid-
242 er and offer applications hosted by the Public Cloud Provider to cloud users (subscribers) over its
243 own private network. The cloud subscribers only interact with the Private Cloud Provider and
244 are unaware of the locations of their applications, as depicted in Figure 6. The Cloud Provider
245 with its own private network will play a role of Cloud Carrier (Actors of Cloud Services) as well.

246

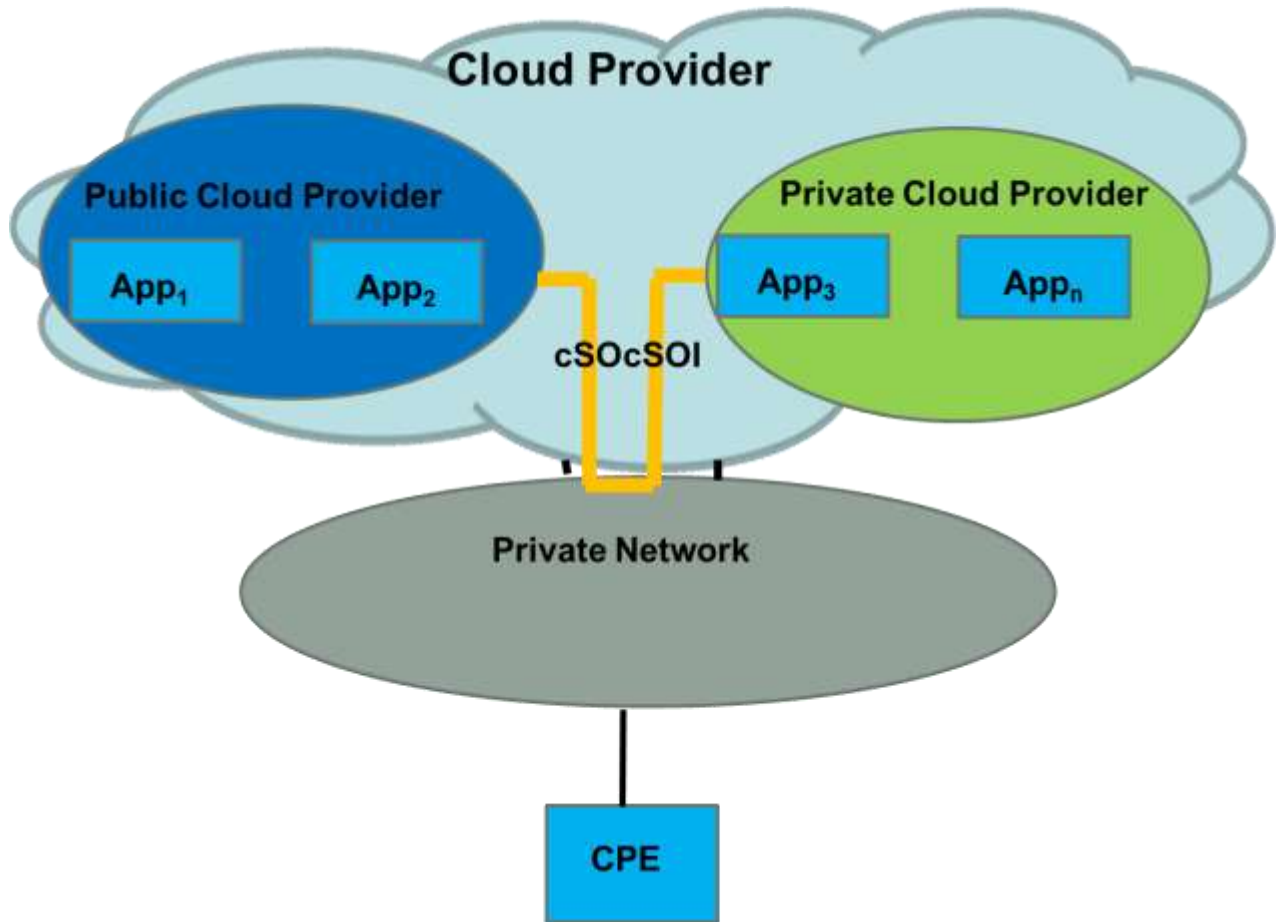

247

248

249

250

251

252

253 **Figure 6** – Access to Private and Public Cloud Provider Combination via Private Network

254

255 **7.4 Cloud Exchange Gateway**

256 Establishing a gateway between two Cloud Carriers, a Cloud Carrier and Cloud Provider, or two
 257 Cloud Providers may not always be justified economically. A Cloud Exchange Gateway
 258 (cEGW) providing connectivity among all parties could be a viable alternative, as depicted in
 259 Figure 7.

260 Via cEGW, cloud subscribers will be able to move their virtualized components (e.g. applica-
 261 tions/VNFs, VMs, containers, or their combinations) from one cP to another. They can also
 262 place their virtualized components in multiple cPs and establish service chains¹ among them.

¹ In this document, a Cloud Service component formed of connected multiple VNFs is called as ‘Service Chain’, instead of Network Service (NS) in ETSI NFV [4].

263
264
265
266
267
268

Figure 7 – Cloud Exchange Gateway among Cloud Carriers and Cloud Providers

269 **8 Actors of Cloud Services**

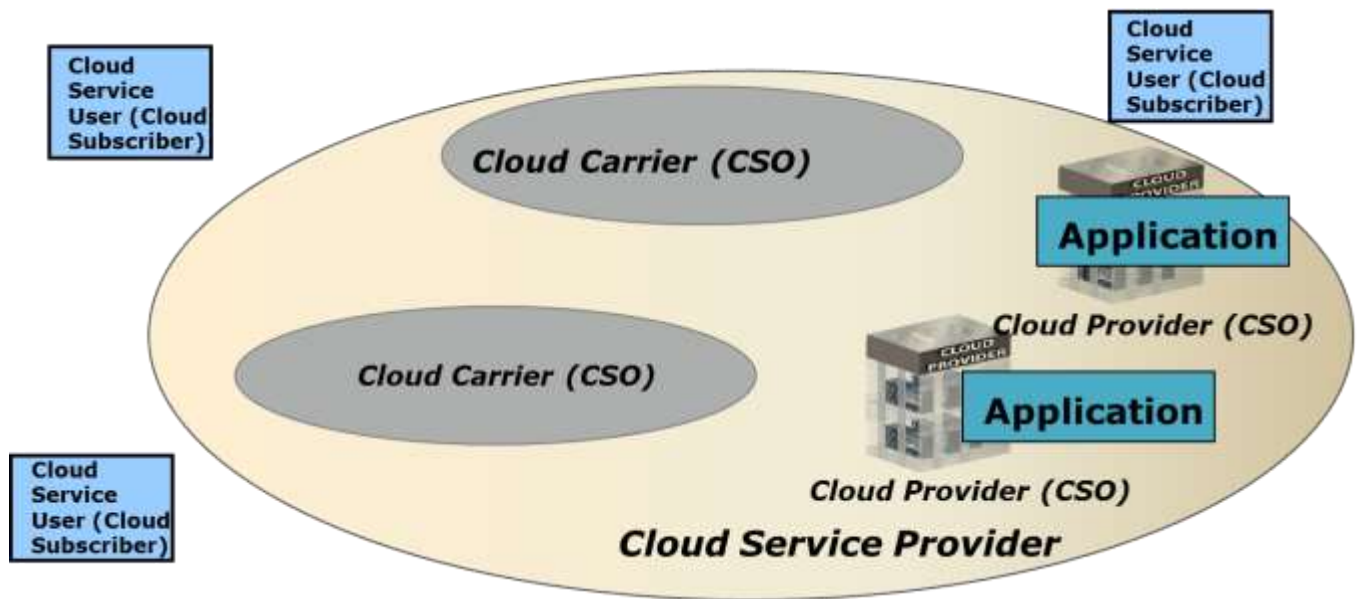

270 The key actors of Cloud Services are depicted in **Figure 8** where a Cloud Service Provider (cSP)
271 is responsible for providing an end-to-end Cloud Service to a Cloud Service User/Subscriber us-
272 ing Cloud Carrier(s) and Cloud Provider(s) [2]. They are described as:

- 273 •Cloud Service: A service provided to a Cloud Subscriber using a shared pool of configura-
274 ble and mobile resources on-demand (e.g., networks, servers, storage, applications) that is
275 uncommon in legacy services.
- 276 •Cloud User/Subscriber/Consumer²: A person or organization that maintains a business rela-
277 tionship with and uses service from a Cloud Service Provider.
- 278 •Cloud Carrier: An intermediary that provides connectivity and transport between Cloud
279 Providers and Subscribers or between Cloud Providers.

² In this document, user, subscriber and consumer are used synonymously.

- 280 •Cloud Provider: An entity that is responsible for making cloud applications available to
281 Cloud Subscribers. It can be public or private.
- 282 •Cloud Service Provider: An entity that is responsible for the creation, delivery and billing of
283 cloud services, and negotiates relationships among Cloud Providers, Cloud Carriers,
284 Cloud Service Operators, and Cloud Subscribers. It is the single point of contact for the
285 subscriber.
- 286 •Cloud Service Operator is an operator that provides a part of the end-to-end Cloud Service
287 which is provided by a Cloud Service Provider.

288

289

290

291

292 **Figure 8 – Actors of Cloud Services**

293 9 Characteristics of Cloud Services

294 Cloud Services provide similar or the same functionalities compared to their legacy counterparts,
295 with greater flexibility in service order, provisioning and billing. For example, security service
296 via a virtual firewall can be provided at customer premises, in a data center in the core network,
297 or anywhere in between, based on the customer request. The firewall can be installed on demand
298 and charged based on its usage.

299

300 Some of the characteristics are listed below. A Cloud Service,

301

- 302 •consists of virtualized components (VNFs) and non-virtualized components (PNFs),

- 303 •consists of network functions with just non-virtualized components (PNFs) or both virtual-
- 304 ized components (VNFs) and non-virtualized components (PNFs);
- 305 •consists of applications built with virtualized components (VNFs);
- 306 •consists of connections provided by one or more Public Cloud Provider (s), Private Cloud
- 307 Provider (s), and Network Operator (s) (i.e. Cloud Carriers);
- 308 •supports elasticity for on-demand service configurations by subscribers and locations of the
- 309 service functionality;
- 310 •supports service monitoring and usage-tracking by subscribers;
- 311 •supports self-service by subscribers and collaboration among Cloud Providers;
- 312 •supports scalability of resources on-demand;
- 313 •supports various high availability options from physical layer to application layer; and
- 314 •supports “pay as you use” (i.e. usage based billing).

315 10 Cloud Services

316 A Cloud Service is an end-to-end service among Cloud Subscribers, Cloud Providers, and Cloud
317 Carriers that can include virtual and non-virtual resources. The Cloud Services maybe grouped
318 under Network as a Service (NaaS), Infrastructure as a Service (IaaS), Platform as Service
319 (PaaS), Software as a Service (SaaS), Communications as a Service (CaaS) and Security as a
320 Service (SECaaS) categories. Services in the same category are expected to have similar charac-
321 teristics.

322 **Fi**

323

324 **Figure 9** depicts an example of building cloud services in a hierarchical fash-
325 ion starting with NaaS where each builds on the previous and provides services
326 for the next in the hierarchy. The hierarchy from the bottom to the top would
327 be NaaS, PaaS, IaaS, SaaS, CaaS and SECaaS. It is also possible to skip the
328 hierarchy and build on top of NaaS, such as building SaaS on top of NaaS, as
329 depicted in **Fi**

330

331 **Figure 9.** This does not mean there is no infrastructure elements underneath. It means that there
332 is no separate IaaS or PaaS or combination underneath.

333

334

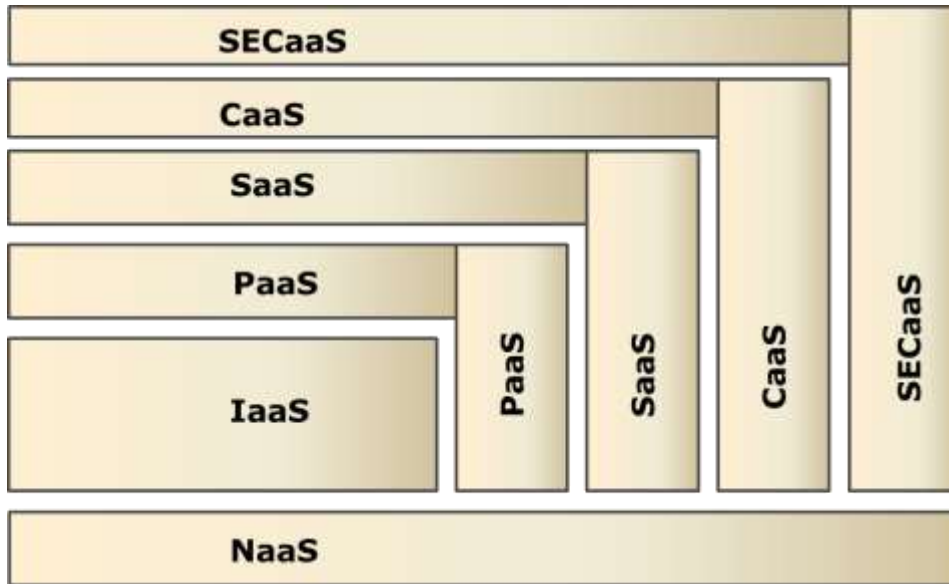

335

336

337

338

339

340

341

Fi

342

343

Figure 9 – Cloud Services

344

10.1 Cloud Service Descriptions

10.2 NaaS

Network as a Service (NaaS) delivers assured and dynamic connectivity services via a virtual connection, and virtual or both physical and virtual service endpoints over one or more operators’ networks. Such services enable users, applications and systems to create, modify, suspend/resume and terminate connectivity services through standardized APIs. These services are assured from both performance and security perspectives.

Some of NaaS characteristics are:

- Connectivity supported through homogenous or heterogeneous networks by one or more operators where one of the operators acting as cSP;
- On-demand network configuration capability;
- QoS-guarantee according to the negotiated service level agreement (SLA); and
- Connection security.

358

359 It is the responsibility of NaaS provider which is aCloud Carrier (cC), or cSP, to maintain and
 360 manage the network resources. It is possible that cSP may not own NaaS, but provides coordina-
 361 tion with cC. NaaS offers network as a utility.

362
 363 NaaS examples are:

- 364 •MEF Carrier Ethernet Network Services [5]
- 365 •IP Network Services [6]
- 366 •SD-WAN [7]

367

368 10.3 IaaS

369

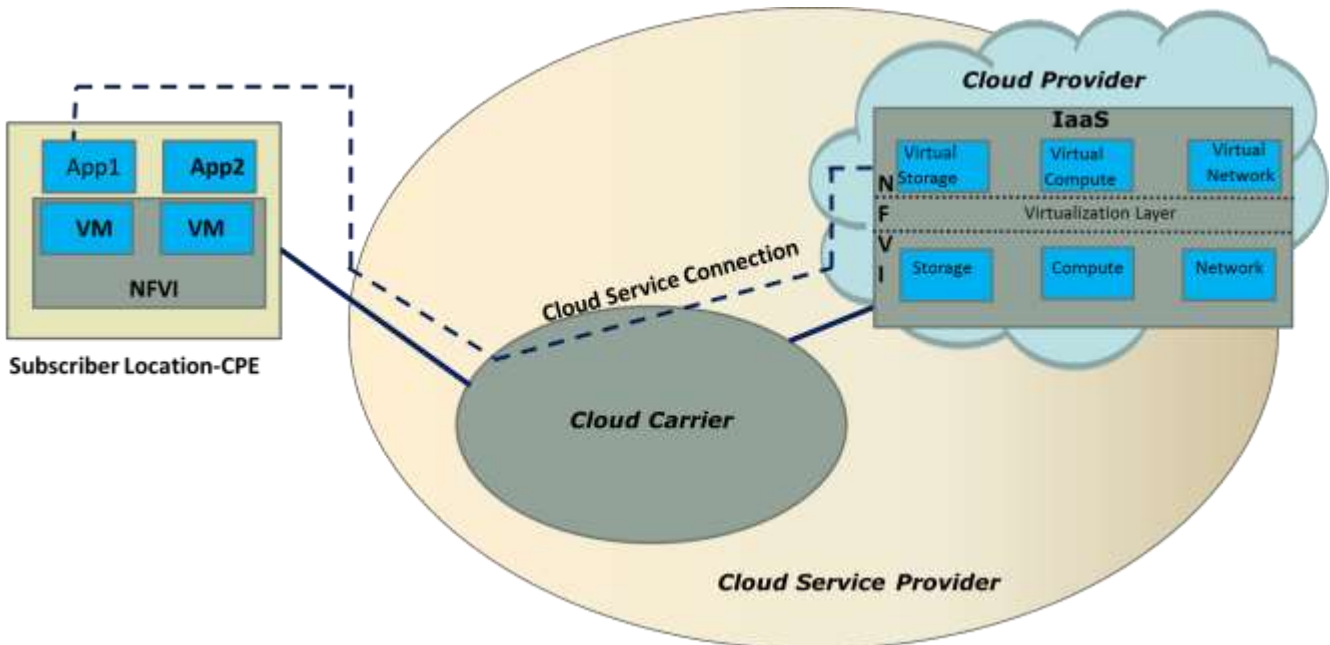

370 The capability provided to the subscriber via IaaS is to provision processing, storage, networks,
 371 and other fundamental computing resources where the consumer is able to deploy and run arbi-
 372 trary software, which can include operating systems and applications. The consumer does not
 373 manage or control the underlying cloud infrastructure, but has control over operating systems,
 374 storage, deployed applications, and possibly limited control of select networking components
 375 (e.g., host firewalls).

376

377 In summary, an IaaS cP configures, deploys and maintains computing, storage and networking
 378 resources for user. Also, the IaaS cP provides the capability for users to use and monitor compu-
 379 ting, storage and networking resources so that they are able to deploy and run arbitrary software.

380

381 An example IaaS is depicted in **Figure 10**. In this example, customer/subscriber may have a
 382 CPE with web browser and no virtualized platform accessing IaaS provided by a cP. The CPE
 383 may have a virtualized platform that is used in conjunction with the IaaS to run certain applica-
 384 tions.

385

386

387

388 NFVI: Network Function Virtualization Infrastructure [8]
389

390 **Figure 10-** An example IaaS architecture

391 For example, Cloud Computing as an IaaS allows subscribers to provision computing and stor-
392 age resources on-demand, specifically storage and virtual servers that can be accessed on de-
393 mand. Virtual datacenters can be created from commodity servers, enabling subscribers to stitch
394 together memory, I/O, storage, and computational capacity as a virtualized resource pool availa-
395 ble over the network.

396 **10.4 PaaS**

397
398 By Platform as a Service (PaaS) [1], the capability provided to the consumer is to deploy onto
399 the cloud infrastructure consumer-created or acquired applications created using programming
400 languages and tools supported by a cP. The consumer does not manage or control the underlying
401 cloud infrastructure including network, servers, operating systems, or storage, but has control
402 over the deployed applications and possibly application hosting environment configurations as
403 depicted in **Figure 11**.

404
405 PaaS can be a stand-alone development environment that does not include technical, licensing or
406 financial dependencies on specific SaaS applications or web services. These development envi-
407 ronments are intended to provide a generalized development environment.

408
409 PaaS can be application delivery-only environments that do not include development, debugging
410 and test capabilities as part of the service, though they may be supplied offline. The services pro-
411 vided generally focus on security and on-demand scalability.

412
413 PaaS can be an Open platform as a service that does not include hosting as such, rather it pro-
414 vides open source software to allow a PaaS provider to run applications. Some open platforms let
415 the developer use any programming language, any database, any operating system, any server,
416 etc. to deploy their applications.

417
418 With PaaS, a scalable and high-performing network can be formed with a fully managed applica-
419 tion platform for running and consolidating software applications and databases in the cloud.

420
421
422

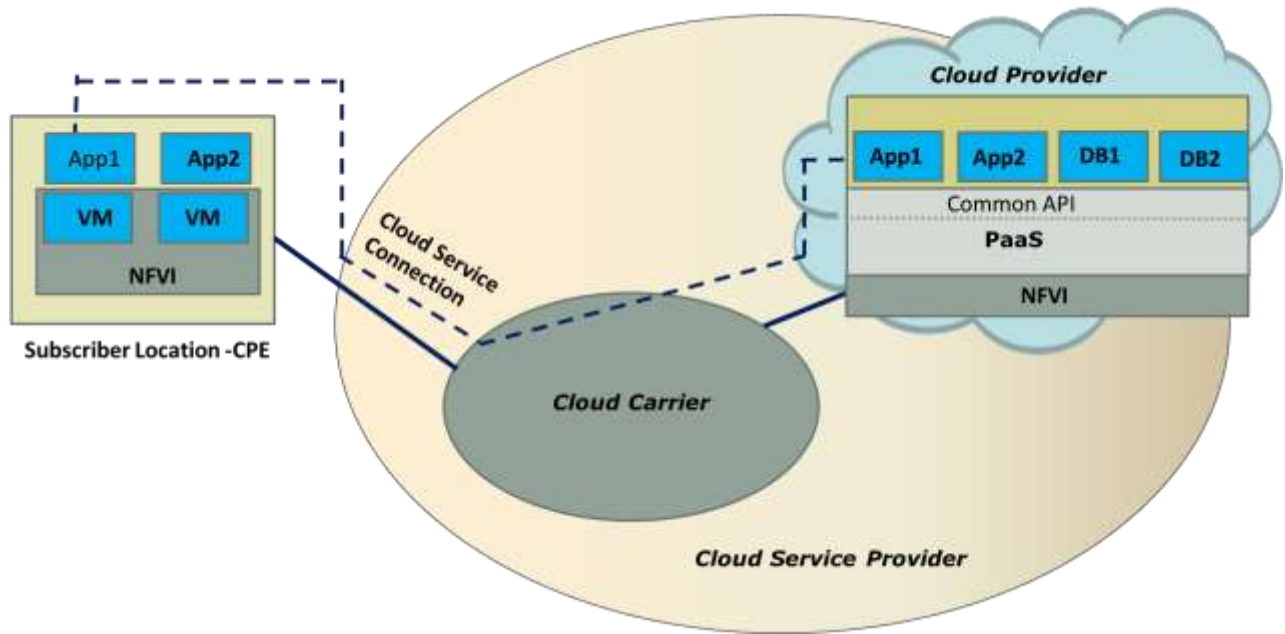

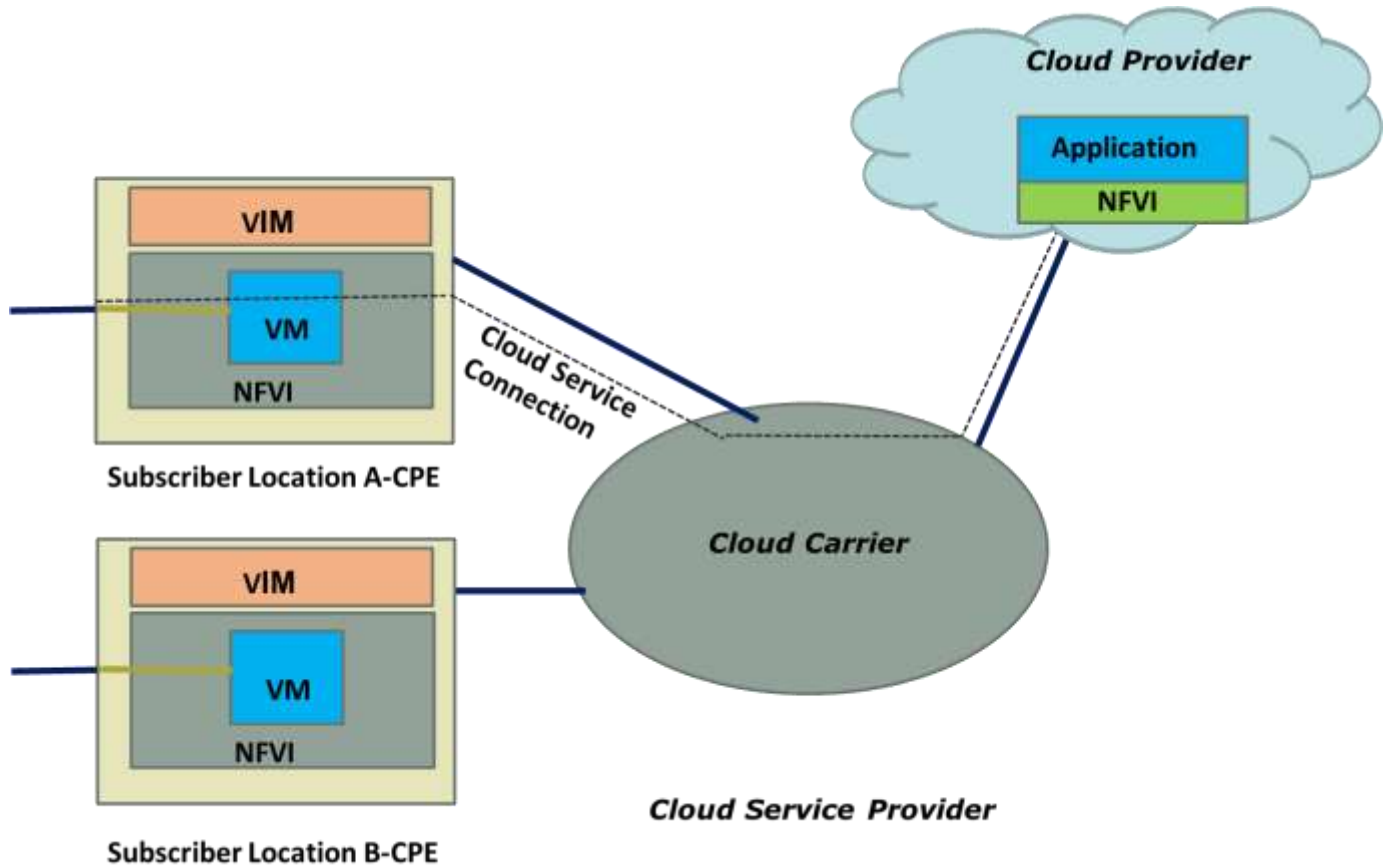

Figure 11- An example PaaS architecture

423
424
425
426
427
428
429
430
431
432
433
434
435

PaaS can be provided via a DC as well as by a Cloud-in-a-Box³. **Figure 12** depicts a virtual platform in a CPE provided by a cSP. A VNF owned and maintained by a subscriber can run over this platform to perform intended service function such as security. The VNF on CPE may service chain with another VNF provided by a Cloud Provider to support additional capabilities.

Cloud Carrier and Cloud Provider could be two different entities requiring a standards interface between them.

³ Cloud in-a-box is an edge computing infrastructure that supports a suite of applications customized to the specific company or industry vertical [9].

436
437
438
439
440

VIM: Virtual Infrastructure Manager [10] VM: Virtual Machine [8]

Figure 12- Cloud-in-Box providing a virtualized platform for consumer managed applications

441 **10.5 SaaS**

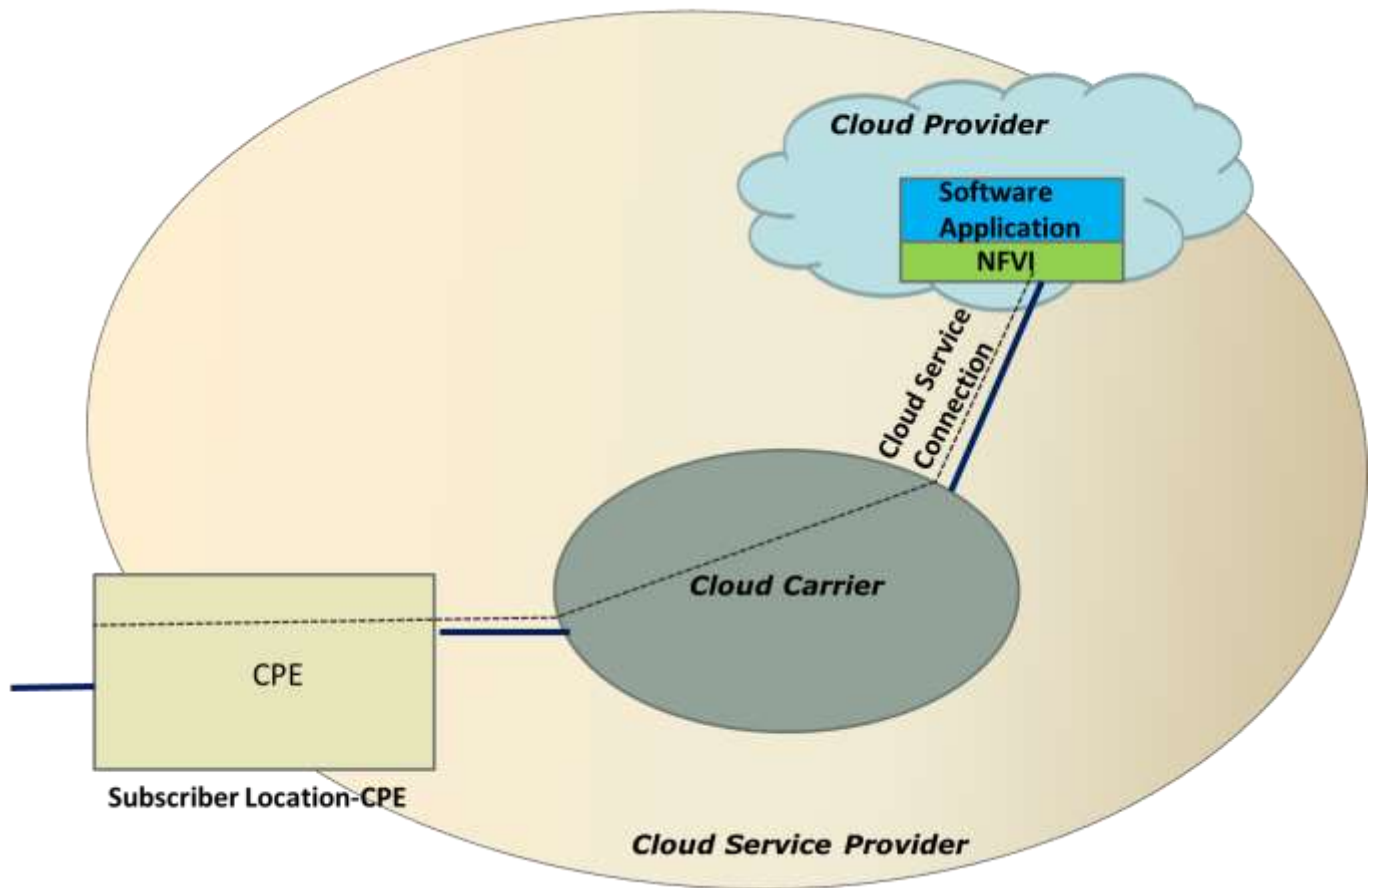

442 The capability provided to the consumer via SaaS [1] is to use the Cloud Provider’s applications
443 running on a cloud infrastructure. The applications are accessible from various client devices
444 through a thin client interface such as a web browser (e.g., web-based email). The consumer does
445 not manage or control the underlying cloud infrastructure including network, servers, operating
446 systems, storage, or even individual application capabilities, with the possible exception of lim-
447 ited user-specific application configuration settings.

448
449 Software is installed on demand and licensed. Open-source and enterprise operating system
450 software options from various vendors could be available.

451
452 **Figure 13** depicts a cloud service user accessing an application VNF (i.e. SaaS).

453
454

455

456

457

458

Figure 13- SaaS provided by cSP

459 10.6 CaaS

460 Real-time services such as Virtual PBX, voice and video conferencing systems, collaboration
 461 systems and call centers can be considered as forming Communication as a Service (CaaS).

462 Some of the services in CaaS category are:

- 463 •Local and domestic long distance point-to-point or multipoint Voice Calling
- 464 •Fixed Mobile Convergence which removes the distinctions between fixed and mobile net-
 465 works, providing seamless services using a combination of fixed broadband and local ac-
 466 cess wireless technologies
- 467 •Voicemail in user inbox or on user smartphone
- 468 •Integrated business communications making calls from user desk or mobile phone and have
 469 it appear as user office number
- 470 •Point-to-point or multipoint Video Calling
- 471 •Point-to-point or multipoint voice and video conferencing
- 472 •Professional voice recording service for user greetings and other messages

473 11 Architectural Components of Cloud Services

474 From sections 9 and 10, we can conclude the following architectural components of cloud ser-
475 vices:

- 476 •Cloud Service Interface between Cloud Subscriber and Cloud Service Provider, Cloud UNI,
477 which is a standards interface for subscribers to connect and operate over cloud plat-
478 forms; and connect and run applications provided by a cSP.
- 479 •Interface between Cloud Subscriber and Application or Cloud Platform, Cloud Application
480 Interface or Cloud Interface (cI)
- 481 •Interface between Cloud Applications, Cloud Interface (cI)
- 482 •Interface between Cloud Carriers, Cloud ENNI
- 483 •Interface between Cloud Carrier and Cloud Provider, Cloud ENNI
- 484 •Interface between Cloud Providers, Cloud ENNI
- 485 •Connection between a Cloud Subscriber and Application, cSC
- 486 •Connection between/among Cloud Subscribers, cSC
- 487 •Connection between/among Cloud Applications, cSC
- 488 •Segment of cSC in a Cloud Service Operator, cSO-c
- 489

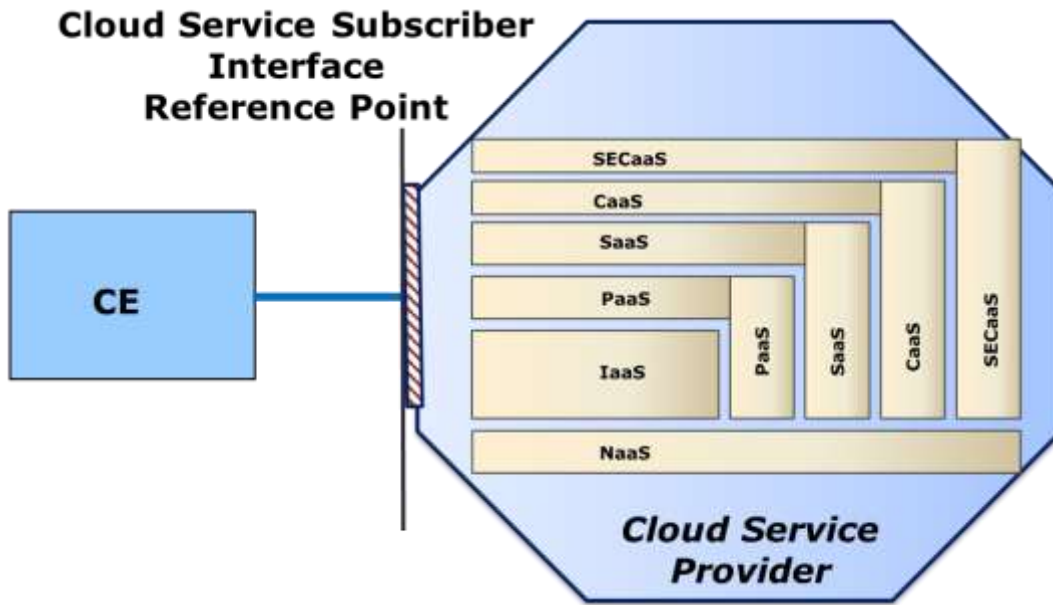

490 11.1 Interfaces

491 11.1.1 Cloud Service Subscriber Interface

492 A Cloud Subscriber interfaces to a Cloud Service Provider (cSP)'s facilities via a Cloud Service
493 Subscriber Interface consisting of Cloud Connectivity UNI and Cloud Application UNI, as de-
494 picted in **Figure 14** and **Figure 15** which are implemented over a bi-directional link that pro-
495 vides the various data, control and management capabilities required by the cSP to clearly de-
496 marcate the two different connectivity domains and two different application domains involved
497 in the operational, administrative, maintenance and provisioning aspects of the service. The
498 Cloud Application UNI may not exist at the Cloud Service Subscriber Interface when only con-
499 nectivity services are offered at this interface.

500 The Cloud Service Subscriber Interface Reference point is the demarcation point between the
501 domains under the responsibility of the cSP and the domains under the responsibility of the
502 Cloud Service Subscriber. It is dedicated to a single Cloud Service Subscriber such as an enter-
503 prise. Multiple flows can be multiplexed over this interface using logical connections.

504

505
506
507
508
509

Figure 14- Cloud Service Subscriber Interface functionalities are distributed between Customer Edge (CE) and cSP.

510
511
512
513
514

Figure 15- Cloud Connectivity UNI and Cloud Application UNI between Customer Edge (CE) and cSP.

515 The subscriber in **Figure 14** and **Figure 15** can be an enterprise with multiple users sharing the
516 same Cloud Service Subscriber Interface where CE may represent a gateway device. It could be
517 a physical equipment with an Internet browser, a VNF/VM/Container, or a collection of
518 VNFs/VMs/Containers with a virtual switch. Individual functional elements in a CE may be ei-
519 ther entirely in the user domain, or may be entirely in the cSP domain and managed by the cSP,
520 or in both sides.

521 From this interface, the subscriber establishes a connection, Cloud Service Connection (cSC),
522 with a Cloud Service Provider (cSP) providing a physical or virtual resources such as physical
523 storage, virtual storage, a virtual machine (VM), Container, and application (i.e. VNF).

524
525 The CE and cSP exchange service packets across the Cloud Service Subscriber Interface. A
526 cloud service packet can be an L1 frame, Ethernet frame, an IP packet, an MPLS packet, or an
527 application Protocol Data Unit (PDU). We will call all of them as PDU in the rest of this specifi-
528 cation.

529
530 The PDU transmitted across the Cloud Service Subscriber Interface toward the Cloud Service
531 Provider is called an ingress service PDU. The PDU transmitted across the Cloud Subscriber In-
532 terface toward the Cloud Service Subscriber is called an egress service PDU.

533 Cloud Service Subscriber Interface protocol stack is depicted in

534

535

536 **Figure 16** that may combine protocol stacks for Cloud Connectivity UNI and Cloud Application
537 UNI as illustrated in **Figure 17** and **Figure 18** , respectively.

538 Depending on the cloud service offering, the protocol stack for Cloud Connectivity UNI can be
539 L1, L2 or L3. For example, Cloud Connectivity UNI is an L2 interface for Carrier Ethernet Ser-
540 vices, an L3 interface for IP services, and L7 interface for multimedia applications.

541 Depending on the service offering, the protocol stack for Cloud Application UNI can be L2 and
542 above. For example, Cloud Application UNI is a L7 interface for multimedia applications.

554 **Figure 17** – Cloud Connectivity UNI Protocol Stack

555

556

557

Figure 18 – Cloud Application UNI Protocol Stack

558

559

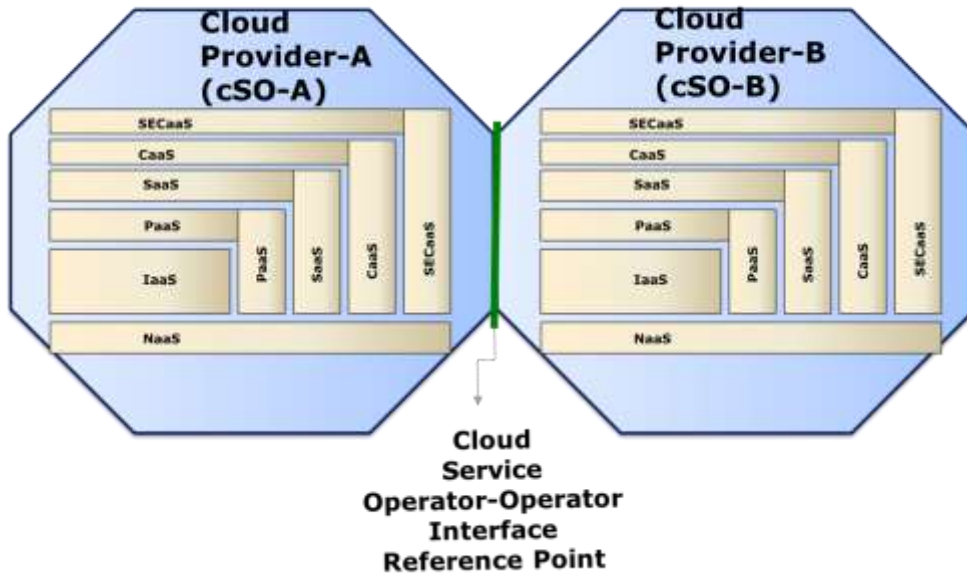

560 **11.1.2 Cloud Service Operator- Operator Interface**

561 As we discussed in Section 7, applications and connectivity to applications can be provided by a
562 single cloud service operator (cSO) as well as multiple cSOs, in providing a cloud service to a
563 cloud subscriber. A cSO represents a Cloud Carrier or a Cloud Provider. The Cloud Provider
564 can be a public or private Cloud Provider.

565 Two cSOs interface to each other via a Cloud Service Operator-Operator Interface as depicted in
566 **Figure 19**. Cloud Service Operator-Operator interface is defined as a reference point represent-
567 ing the boundary between two cSOs that are operated as separate administrative domains. This
568 reference point provides demarcation between two cSOs for cloud services.

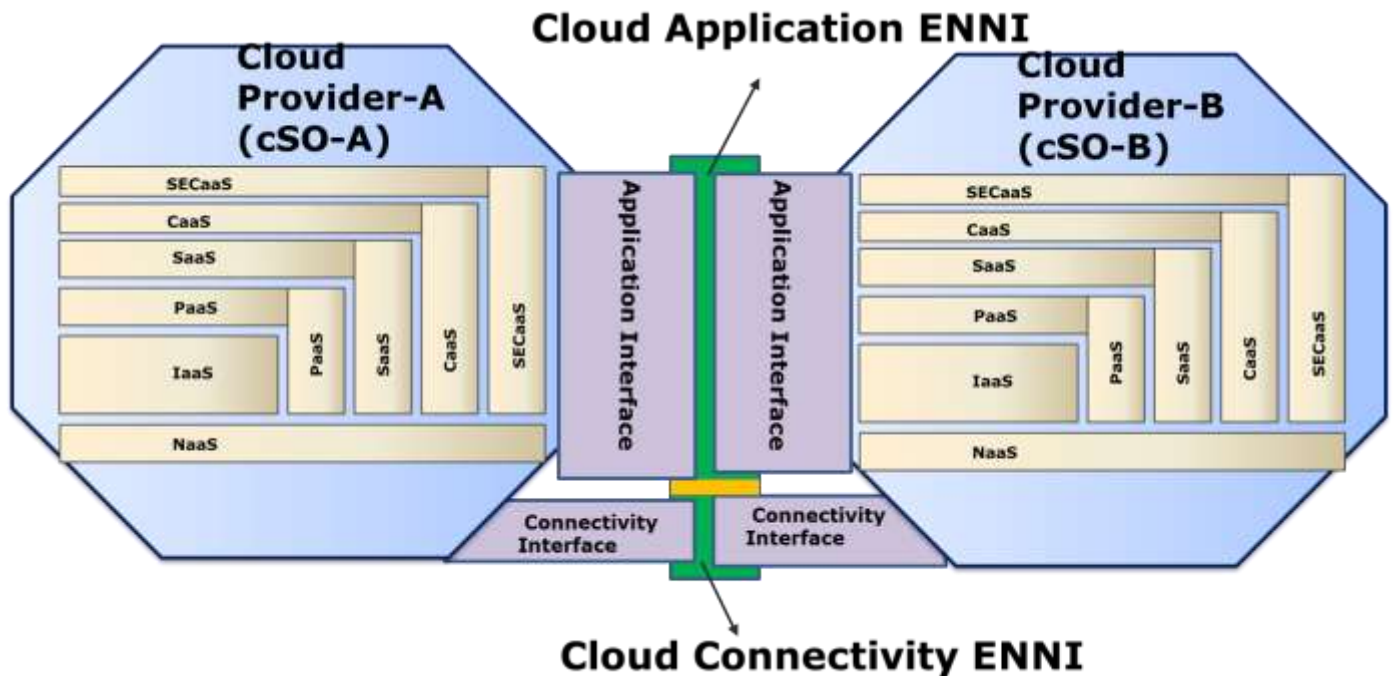

569 Cloud Service Operator-Operator Interface consisting of Cloud Connectivity ENNI and Cloud
570 Application ENNI as illustrated in **Figure 21****Figure 20**. The Cloud Application ENNI may not
571 exist at the Cloud Service Operator-Operator Interface when only connectivity services are of-
572 fered at this interface.

573

574

578
579
580

Figure 20 – Cloud Connectivity ENNI and Cloud Application ENNI between two cSOs.

581 The protocol stacks for Cloud Connectivity ENNI and Cloud Application ENNI are described in
582 **Figure 21** –Cloud Connectivity ENNI Protocol Stack between two cSOs.**Figure 21** and **Figure**
583 **22**.

584

585

586

587 **Figure 21** –Cloud Connectivity ENNI Protocol Stack between two cSOs.

588

589

590 **Figure 22** –Cloud Application ENNI Protocol Stack.

591

592

593 Cloud Connectivity ENNI is expected to be very similar to ENNI [13] if the interface is an L2
 594 Ethernet interface.

595 cSOs may use a gateway to interface to external entities as described in Appendix-A.

596

597 **11.1.3 Cloud Application Interface**

598

599 The Cloud Application Interface is the interface of a Cloud Service Application or Cloud Service
 600 Platform supported by a Cloud Provider (cP) or a Cloud Service Provider (cSP). Therefore, it
 601 can be an interface of a VNF, VM or Container, as depicted in **Figure 23, Figure 24, Figure**
 602 **25, Figure 26, and Figure 27.**

Cloud Application Interface could be Cloud Application UNI or Cloud Application ENNI, with its protocol stack, as illustrated in **Figure 15**, **Figure 18**, **Figure 20** and **Figure 22**.

Depending on service offerings, the protocol stack can be L2 and above. For example, Cloud Application Interface is an L2 interface for WAN Optimization, L3 interface for SD-WAN, Virtual Router, and L7 interface for multimedia applications.

An example for protocol stack and examples of subscriber configuration parameters for cI are given in the Appendix-B.

11.2 Connection and Connection End Points

Connection and connection end points providing cloud services are depicted in **Figure 28** for a Cloud Service Connection (cSC) crossing one or more administrative domains.

When a cSC crosses multiple cSOs, the cSC segments and their end points in each cSO are called cSO-c (Cloud Service Operator Connection) and Cloud Service Operator Connection End Point (cSOCEP), respectively.

The following sections will describe them in details.

656
657
658
659

665

(b) cSC between two end points residing on the resources of two different cSOs

Figure 28- Cloud Service Connection and Segments

666

667

668 **11.2.1 Cloud Service Connection End Point (cSCEP)**

669 The cSCEP is an end point of a cSC when the cSC is within the boundaries of one ad-
670 ministrative domain. Cloud Subscribe Interface identifier, availability, bandwidth profile, param-
671 eters of security functionalities, administrative state and operational state are among the attrib-
672 utes of cSCEP.

673 For implementations using Ethernet Virtual Connection (EVC), attributes of “EVC Per UNI” in
674 [5], L2CP in [11] and L2 SOAM [12] are a subset of the attributes of cSCEP.

675 Some or all of cSCEP attributes can be modified on-demand, depending on the implementation.

676

677 **11.2.2 Cloud Service Connection (cSC)**

678 The cSC is a cross connect between two or more cSCEPs. The cSC could be an EVC, LSP, IP
679 VPN or SD-WAN connection. Identifiers of cSCEPs associated with this cSC, connection type,
680 SLS, redundancy, connection start time, connection duration, connection period, billing options,
681 MTU, administrative and operational states are among the attributes of cSC.

682 For implementations using Ethernet Virtual Connection (EVC), EVC service attributes in [5],
 683 and EVC performance attributes and parameters in [5] are a subset of attributes of cSC.

684 A cSC can support connecting multiple VMs via multiple sessions as depicted in **Figure 27**
 685 where a virtual switch routes traffic to destination VM.

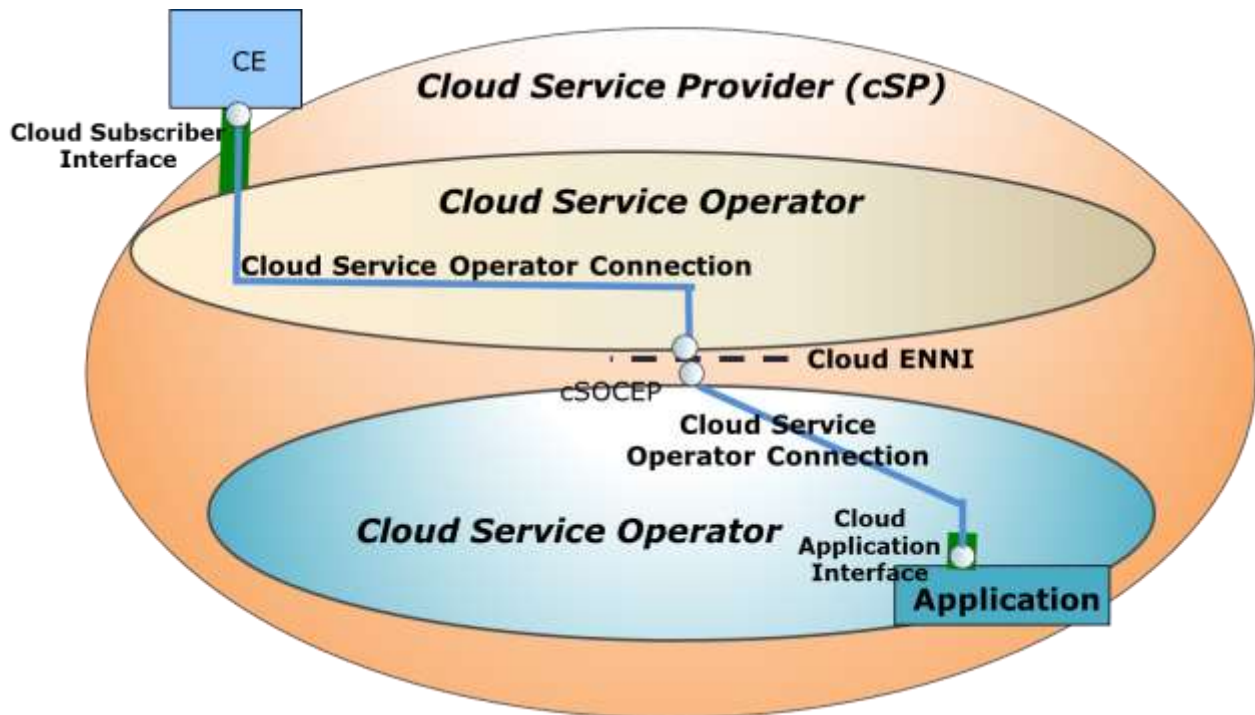

686 Some or all of cSC attributes can be modified on-demand, depending on the implementation.

687 **11.2.3 Cloud Service Operator Connection (cSO-c)**

688 The cSC may cross multiple Cloud Service Operator domains as depicted in **Figure 29**. Each
 689 domain will carry a segment of the cSC. The segment in each cSO domains is called Cloud Ser-
 690 vice Operator Connection (cSO-c).

691 cSO_c is another cSC. We call them differently to identify the connection whether it is a seg-
 692 ment or an end-to-end connection.

693

694

695

696 **Figure 29-** Segments of cSC crossing multiple cSOs.

697 The cSO-c is a cross connect between two cSOCEPs. The cSO-c could be very similar to san
 698 Operator Virtual Connection (OVC), LSP, IP VPN connection segment, or SD-WAN connec-
 699 tion.

700 Identifiers of cSOCEPs associated with this cSO-c, connection type, SLS, redundancy, connec-
701 tion start time, connection duration, connection period, billing options, MTU, administrative and
702 operational states are among the attributes of cSO-c.

703 For implementations using OVC, OVC service attributes including CoS preservation in [13] are
704 a subset of attributes of cSO-c.

705 Some or all of cSO-c attributes can be modified on-demand, depending on the implementation.

706 **11.2.4 Cloud Service Operator Connection End Point (cSOCEP)**

707 The cSOCEP is an end point of a cSO-c when the cSO-c is within the boundaries of one ad-
708 ministrative domain. For high availability, cSOCEP can be redundant where primary and sec-
709 ondary units could be located at different devices. Cloud Service Operator-Operator Interface
710 identifier, Cloud Subscriber Interface identifier, band-width profile, parameters of security func-
711 tionalities, administrative state and operational state are among the attributes of cSOCEP.

712 cSOCEP at Cloud Subscriber Interface or Cloud Application UNI is equivalent to the cSCEP at
713 Cloud Subscriber Interface or Cloud Application UNI.

714 For implementations using OVC, attributes of “OVC per ENNI”, “OVC Per UNI” in [5], L2CP
715 in [11] and L2 SOAM [12] are a subset of the attributes of cSOCEP.

716 Some or all of cSOCEP attributes can be modified on-demand, depending on the implementa-
717 tion.

Appendix A Cloud Service Gateway (Informative)

755

757 The cSOs may employ a gateway, Cloud Service Gateway (cSGW), to connect to each other
758 as depicted in

759

760 **Figure 30.** The cSGW might provide connection multiplexing among other features that are re-
761 quired by cSOcSOI such as Cloud ENNI link redundancy.

782 SDP: Session Description Protocol

783 SIP: Session initiation protocol

784 **Figure 31 – SIP Protocol Stack for Session Border Controllers**

785

786

787 VNF and VM interfaces are more common Cloud Interfaces. As indicated in Section 7, VNF
788 and/or VM can be configured and managed by an SP as well as self-configured by a subscriber.

789 **B.1 Virtual Machine (VM) Attributes**

790 After a subscriber connects to the virtual platform provided by an SP, some of the attributes that
791 a subscriber configures for CI are:

- 792 •Number of Virtual CPUs
- 793 •Size of Virtual RAM
- 794 •Size and Locations of Virtual Disks
- 795 •Virtual NIC (s) and associated MAC addresses and IP addresses
- 796 •Guest Operating System
- 797 •Inbound Traffic Port
- 798 •Outbound Traffic Port
- 799 •Redundancy with Affinity or Anti-Affinity
- 800 •Single Root I/O Virtualization (SR-IOV) Support

801

802 **B.2 Virtual Network Function (VNF) Attributes**

803

804 Applications such as virtual phone, virtual router and virtual firewall are provided by VNFs.
805 Clearly each VNF has its own unique attributes. Below are some of the attributes of a vR to be
806 configured either by the cSP as part of Day-0 and Day-1 configurations, and by the subscriber as
807 part of Day-2 configurations⁴.

- 808 •License Type
- 809 •Fragmentation and Reassembly
- 810 •Single tenant
 - 811 ○VLAN ID
 - 812 ○Tenant VRF
- 813 •Multiple tenants
 - 814 ○VDC (Virtual Data Center)
 - 815 ○VLAN IDs
 - 816 ○Tenant VRFs
- 817 •Routing protocol and option configurations
 - 818 ○Static Routing
 - 819 ○BGP
 - 820 ○EIGRP
 - 821 ○Intermediate system-to-intermediate system (IS-IS)
 - 822 ○Open shortest path first (OSPF)
- 823 •Loopback Address

⁴ There is no consensus about the definitions of Day-0,1 and 2 for a VNF. We use the followings in this document:
a) Day 0: VNF image is uploaded and on-boarded. b) Day 1: VNF interfaces and network connectivity have been configured. It is ready to carry traffic c) Day 2: Customer configurations can be performed. Billing and performance reports are available.

- 824 •NTP Server IP
- 825 •Routing table groups
- 826 •IP Multicast
 - 827 ○Internet Group Management Protocol (IGMP)
 - 828 ○Protocol Independent Multicast (PIM)
- 829 •Per-packet load balancing
 - 830 ○Equal-cost multi-path routing (ECMP)
- 831 •Autonomous system numbers (ASNs)
- 832 •Autonomous system confederation ID and members
- 833 • Fault Management Protocols
 - 834 ○Internet Control Message Protocol (ICMP)
 - 835 ○Bidirectional Forwarding Detection (BFD)
- 836 •DHCP Relay
- 837 •MAC addresses, IPv4/6 addresses
- 838 •Encapsulation
 - 839 ○GRE
- 840 • VPN
 - 841 •Dynamic multipoint virtual private network (DMVPN)
 - 842 •FlexVPN
 - 843 •Secure Sockets Layer (SSL) VPN
- 844 •MPLS
- 845 • SNMP
- 846 •Secure Shell (SSH)
- 847 •Network address translation (NAT)
- 848 •Remote Authentication Dial-In User Service (RADIUS)

849
850 As Cloud Services are defined by MEF, attributes of each interface including cI, connection and
851 connection end points are expected to be defined in details as part of these service definitions.
