

# Tutorial: Making and Testing a Schema Change in A&AI in Beijing Release

1. Set up a development environment as described in [A&AI Developer Environment Setup - Updated for Beijing!](#)
2. This document will show editing schema files with Eclipse, but Eclipse is not required.
3. In this example, we will add 2 new attributes to the cloud-region node type and a new node type called "new-widget" which will be a child node of "cloud-region"
4. Adding a new attribute to "cloud-region"
5. Open aai/aai-common, aai-schema/src/main/resources/oxm/aai\_oxm\_v11.xml

6. Add the following attributes between "complexName" and "resourceVersion":

```
<xml-element java-attribute="complexName" name="complex-name" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="complex name for cloud-region instance. NOTE - THIS FIELD IS NOT CORRECTLY
POPULATED." />
</xml-properties>
</xml-element>
<xml-element java-attribute="newAttributeForDemo" name="new-attribute-for-demo" required="true" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="Example new attribute for cloud-region instance. " />
</xml-properties>
</xml-element>
<xml-element java-attribute="numberAttributeForDemo" name="number-attribute-for-demo" required="true" type="java.lang.
Integer">
<xml-properties>
<xml-property name="description" value="Example number attribute for cloud-region instance. " />
</xml-properties>
</xml-element>
<xml-element java-attribute="resourceVersion" name="resource-version" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="Used for optimistic concurrency. Must be empty on create, valid on update and delete." />
</xml-properties>
</xml-element>
```

7. Save the file, and rebuild the libraries and microservices:

here's my example file: [aai\\_oxm\\_v11.xml](#)

- a. Rebuild aai-common first:
- b. \$ cd ~/LF/AI/aai-common
- c. \$ mvn versions:set -DnewVersion=0.0.1-TEST-SNAPSHOT
- d. \$ mvn clean install  
Should result in BUILD SUCCESS

- e. \$ cd ~/LF/AI/resources
- f. \$ mvn clean install -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT  
Should result in BUILD SUCCESS
- g. \$ cd ~/LF/AI/traversal  
mvn clean install -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT
- h. Should result in BUILD SUCCESS

From <https://lists.onap.org/g/onap-discuss/message/11507>:

*The html and yaml gets automatically generated when you run install but the xsd was never part of the autogenerate maven profile.  
For Beijing and earlier release, we never auto generated it. In order to run the generation of the xsd, here is the command:*

```
cd ~/LF/aai/aai-common/aai-core/
mvn -PgenerateXsd install -DskipTests -Dgendoc.version=v14
```

*I have actually noticed that recently within the internal release and realized that it makes sense for xsd to be also auto generated.  
I am not sure why it was left out from the autogenerate profile but when developing the model driven feature, I ensured that the auto generate also does xsd generation.  
Once that feature gets delivered to Casablanca, there wouldn't be a need to run the profile manually.*

## 8. Run GenTester, using the target dir under aai-resources:

```
$ cd ~/LF/AI/graphadmin;
java -DAJSC_HOME= -DBUNDLECONFIG_DIR=src/main/resources/ -Dloader.main=org.onap.aai.schema.GenTester -Dloader.path=.
/src/main/resources -Dschema.ingest.file=src/main/resources/application.properties -jar target/aai-graphadmin-* .jar
```

You should see the following output:

```
---- NOTE --- about to open graph (takes a little while)-----
-- loading schema into JanusGraph
-- loading schema into JanusGraph
-- Loading new schema elements into JanusGraph --
-- graph commit
-- graph shutdown
```

You can check the logs to see if the graph elements were created successfully and grep for your property  
cd logs/createDBSchema/;

grep 'complex-name' metrics.log

```
2018-12-06T04:43:18.061+0000|2018-12-06T04:43:42.960+0000|449b8583-54c1-42bf-8ada-5b75c52d7a13||main ||AAI|AAI-
TOOLS|AAI|main|COMPLETE|0|||INFO||127.0.1.1|24899||localhost||org.onap.a
ai.dbgen.SchemaGenerator||||||co=DBGenTester:Creating PropertyKey: [complex-name], [String], [SINGLE]
2018-12-06T04:43:18.061+0000|2018-12-06T04:43:42.960+0000|449b8583-54c1-42bf-8ada-5b75c52d7a13||main ||AAI|AAI-
TOOLS|AAI|main|COMPLETE|0|||INFO||127.0.1.1|24899||localhost||org.onap.a
ai.dbgen.SchemaGenerator||||||co=DBGenTester:Add index for PropertyKey: [complex-name]
```

9. Start the "resources" microservice
  - a. Resources runs on port 8447. Go to the resources directory  
\$ cd ~/LF/AI/resources
  - b. Set the debug port to 9447  
\$ export MAVEN\_OPTS="-Xms1024m -Xmx5120m -XX:PermSize=2024m -Xdebug -Xnoagent -Djava.compiler=NONE -Xrunjdwp:
 transport=dt\_socket,address=9447,server=y,suspend=n"
  - c. Start the microservice  
\$ mvn -pl aai-resources -P runAjsc -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT
10. Start the "traversal" microservice
  - a. Traversal runs on port 8446. Go to the traversal directory  
\$ cd ~/LF/AI/traversal

- b. Set the debug port to 9446
 

```
$ export MAVEN_OPTS="-Xms1024m -Xmx5120m -XX:PermSize=2048m -Xdebug -Xnoagent -Djava.compiler=NONE -Xrunjdwp:transport=dt_socket,address=9446,server=y,suspend=n"
```
- c. Start the microservice
 

```
$ mvn -pl aai-traversal -P runAjs -Daaicore.version=0.0.1-TEST-SNAPSHOT -Daaicschema.version=0.0.1-TEST-SNAPSHOT
```

Should see something like this: Traversal Microservice Started

## 11. Get an example cloud-region object, postman: [Cloud-Region Example.postman\\_collection.json](#)

```

<?xml version="1.0" encoding="UTF-8"?>
<cloud-region xmlns="http://org/openstack/aaicloud-region/v1">
  <id>44086</id>
  <cloud-region-id>example</cloud-region-id>
  <owner-defined-type>example</owner-defined-type>
  <owner>owner-defined-type</owner>
  <cloud-region-version>1.0</cloud-region-version>
  <identity-url>example.identity.url</identity-url>
  <cloud-zone>example</cloud-zone>
  <new-attribute-for-demo>example-new-attribute-for-demo</new-attribute-for-demo>
  <new-attribute-for-demo>val-1234</new-attribute-for-demo>
</cloud-region>

```

You should see the new attributes on the example object, as highlighted in the red rectangle above  
 12. Copy and paste the example object and PUT it to persist the new attributes. Use this postman collection thru step 15

```

<?xml version="1.0" encoding="UTF-8"?>
<cloud-region xmlns="http://org/openstack/aaicloud-region/v1">
  <id>44086</id>
  <cloud-region-id>example</cloud-region-id>
  <owner-defined-type>example</owner-defined-type>
  <owner>owner-defined-type</owner>
  <cloud-region-version>1.0</cloud-region-version>
  <identity-url>example.identity.url</identity-url>
  <cloud-zone>example</cloud-zone>
  <new-attribute-for-demo>example-new-attribute-for-demo</new-attribute-for-demo>
  <new-attribute-for-demo>val-1234</new-attribute-for-demo>
</cloud-region>

```

13. Check the object by doing a GET: GET Cloud-Region (no depth param) in postman collection

The Postman interface shows a collection named "Cloud-Region Example". A GET request is selected with the URL `https://127.0.0.1:8443/aai/v11/cloud-infrastructure/cloud-regions/cloud-region/example-cloud-owner-val-44086/ex...`. The Headers tab shows:

Key	Value	Description
Content-Type	application/xml	
X-TransactionId	9999	
X-FromAppId	jimmy-postman	
Real-Time	true	
Authorization	Basic QUFjOkFBQS==	

The Body tab shows the XML response:

```

<?xml version="1.0" encoding="UTF-8"?>
<cloud-region xmlns="http://org.oceanbase.aai.inventory/v11">
  <cloud-owner>example</cloud-owner>
  <cloud-region-id>example</cloud-region-id>
  <owner-defined-type>example-owner-defined-type-val-44086</owner-defined-type>
  <cloud-type>example</cloud-type>
  <identity-url>example</identity-url>
  <complex-name>example</complex-name>
  <new-attribute-for-demo>example-new-attribute-for-demo-val-4845</new-attribute-for-demo>
  <resource-version>1501178717681</resource-version>
</cloud-region>

```

14. Add the depth parameter: GET Cloud-Region (depth = all) in postman collection

The Postman interface shows a collection named "Cloud-Region Example". A GET request is selected with the URL `https://127.0.0.1:8443/aai/v11/cloud-infrastructure/cloud-regions/cloud-region/example-cloud-owner-val-44086/ex...`. The Headers tab shows:

Key	Value	Description
depth	all	

The Body tab shows the XML response:

```

<?xml version="1.0" encoding="UTF-8"?>
<cloud-region xmlns="http://org.oceanbase.aai.inventory/v11">
  <cloud-owner>example</cloud-owner>
  <cloud-region-id>example</cloud-region-id>
  <cloud-type>example</cloud-type>
  <owner-defined-type>example-owner-defined-type-val-3871</owner-defined-type>
  <identity-url>example</identity-url>
  <complex-name>example</complex-name>
  <new-attribute-for-demo>example-new-attribute-for-demo-val-4845</new-attribute-for-demo>
  <resource-version>1501178717681</resource-version>
</cloud-region>

```

a. This indicates that the schema has been updated with the new attributes and they are making it to the database

15. Clear the cloud region and then delete it by using "Clear Cloud-Region" and "Delete Cloud-Region"

a. note: you will need to perform a GET each time and update the resource version of the cloud-region in the XML payload for the clear, and do the GET again and update the resource-versionQueryParam to perform the delete

16. Run PUT Cloud-Region - missing attr. This will try to PUT the object without the required attribute we defined in the schema, and the response will look like this:

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Fault>
<requestError>
<serviceException>
<messageId>SVC3000</messageId>
<text>Invalid input performing %1 on %2 (msg=%3) (ec=%4)</text>
<variables>
<variable>PUT</variable>
<variable>v11/cloud-infrastructure/cloud-regions/cloud-region/example-cloud-owner-val-44086/example-cloud-region-id-val-67393</variable>
<variable>Invalid input performing %1 on %2:Missing required property: new-attribute-for-demo</variable>
<variable>ERR.5.2.3000</variable>
</variables>
</serviceException>
</requestError>
</Fault>

```

17. Adding a new node type. First, add the container under the top-level inventory category. Adding "newWidgets" to "Network" so the URI will be "aai/v11/network/new-widgets/new-widget/{new-widget-name}"

```
<java-type name="Network">
<xml-properties>
<xml-property name="description" value="Namespace for network inventory resources." />
</xml-properties>
<xml-root-element name="network" />
<java-attributes>
<xml-element java-attribute="logicalLinks" name="logical-links" type="inventory.aai.onap.org.v11.LogicalLinks" />
<xml-element java-attribute="sitePairSets" name="site-pair-sets" type="inventory.aai.onap.org.v11.SitePairSets" />
<xml-element java-attribute="vpnBindings" name="vpn-bindings" type="inventory.aai.onap.org.v11.VpnBindings" />
<xml-element java-attribute="vplsPes" name="vpls-pes" type="inventory.aai.onap.org.v11.VplsPes" />
<xml-element java-attribute="multicastConfigurations" name="multicast-configurations" type="inventory.aai.onap.org.v11.MulticastConfigurations" />
<xml-element java-attribute="vces" name="vces" type="inventory.aai.onap.org.v11.Vces" />
<xml-element java-attribute="vpes" name="vpes" type="inventory.aai.onap.org.v11.Vpes" />
<xml-element java-attribute="vnfcS" name="vnfcS" type="inventory.aai.onap.org.v11.VnfcS" />
<xml-element java-attribute="l3Networks" name="l3-networks" type="inventory.aai.onap.org.v11.L3Networks" />
<xml-element java-attribute="networkPolicies" name="network-policies" type="inventory.aai.onap.org.v11.NetworkPolicies" />
<xml-element java-attribute="genericVnfs" name="generic-vnfs" type="inventory.aai.onap.org.v11.GenericVnfs" />
<xml-element java-attribute="lagLinks" name="lag-links" type="inventory.aai.onap.org.v11.LagLinks" />
<xml-element java-attribute="newvces" name="newvces" type="inventory.aai.onap.org.v11.Newvces" />
<xml-element java-attribute="pnfs" name="pnfs" type="inventory.aai.onap.org.v11.Pnfs" />
<xml-element java-attribute="physicalLinks" name="physical-links" type="inventory.aai.onap.org.v11.PhysicalLinks" />
<xml-element java-attribute="newWidgets" name="new-widgets" type="inventory.aai.onap.org.v11.NewWidgets" />
<xml-element java-attribute="ipsecConfigurations" name="ipsec-configurations" type="inventory.aai.onap.org.v11.IpsecConfigurations" />
<xml-element java-attribute="routeTableReferences" name="route-table-references" type="inventory.aai.onap.org.v11.RouteTableReferences" />
<xml-element java-attribute="instanceGroups" name="instance-groups" type="inventory.aai.onap.org.v11.InstanceGroups" />
<xml-element java-attribute="zones" name="zones" type="inventory.aai.onap.org.v11.Zones" />
</java-attributes>
</java-type>
```

18. Set up the "NewWidgets" java type:

```
<java-type name="NewWidgets">
<xml-properties>
<xml-property name="description" value="Collection of new Widgets" />
</xml-properties>
<xml-root-element name="new-widgets" />
<java-attributes>
<xml-element container-type="java.util.ArrayList" java-attribute="newWidget" name="new-widget" type="inventory.aai.onap.org.v11.NewWidget" />
</java-attributes>
</java-type>
```

19. Set up the NewWidget java type:

```
<java-type name="NewWidget">
<xml-root-element name="new-widget" />
<java-attributes>
<xml-element java-attribute="newWidgetName" name="new-widget-name" required="true" type="java.lang.String" xml-key="true">
<xml-properties>
<xml-property name="description" value="e.g.,awesome-new-widget, terrific-new-widget" />
</xml-properties>
</xml-element>
<xml-element java-attribute="newWidgetType" name="new-widget-type" required="true" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="Type of new Widget, e.g., fantastic, amazing" />
</xml-properties>
</xml-element>
<xml-element java-attribute="resourceVersion" name="resource-version" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="Used for optimistic concurrency. Must be empty on create, valid on update and delete." />
</xml-properties>
</xml-element>
<xml-element java-attribute="modelInvariantId" name="model-invariant-id" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="the ASDC model id for this resource or service model." />
<xml-property name="visibility" value="deployment" />
<xml-property name="requires" value="model-version-id" />
```

```

<xml-property name="dbAlias" value="model-invariant-id-local" />
</xml-properties>
</xml-element>
<xml-element java-attribute="modelVersionId" name="model-version-id" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="the ASDC model version for this resource or service model." />
<xml-property name="visibility" value="deployment" />
<xml-property name="requires" value="model-invariant-id" />
<xml-property name="dbAlias" value="model-version-id-local" />
</xml-properties>
</xml-element>
<xml-element java-attribute="newWidgetId" name="new-widget-id" type="java.lang.String">
<xml-properties>
<xml-property name="description" value="ID of the newWidget" />
</xml-properties>
</xml-element>
<xml-element java-attribute="relationshipList" name="relationship-list" type="inventory.aai.onap.org.v11.RelationshipList" />
</java-attributes>
<xml-properties>
<xml-property name="description" value="New widgets are the best widgets. Our new widgets are really, really great." />
<xml-property name="indexedProps" value="new-widget-id,new-widget-name,model-invariant-id,model-version-id" />
<xml-property name="uniqueProps" value="new-widget-id" />
<xml-property name="container" value="new-widgets" />
<xml-property name="namespace" value="network" />
<xml-property name="searchable" value="new-widget-name,new-widget-id" />
</xml-properties>
</java-type>

```

**20.** Save the file, and rebuild the libraries and microservices:

here's my example file: [aai\\_oxm\\_v11.xml](#)

- a. Rebuild aai-common first:
- b. \$ cd ~/LF/AAI/aai-common
- c. \$ mvn versions:set -DnewVersion=0.0.1-TEST-SNAPSHOT
- d. \$ mvn clean install  
Should result in BUILD SUCCESS
- e. \$ cd ~/LF/AAI/resources
- f. \$ mvn clean install -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT  
Should result in BUILD SUCCESS
- g. \$ cd ~/LF/AAI/traversal  
mvn clean install -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT
- h. Should result in BUILD SUCCESS

**21.** Run GenTester, using the target dir under aai-resources:

```

$ cd ~/LF/AAI/graphadmin;

java -DAJSC_HOME=. -DBUNDLECONFIG_DIR=src/main/resources/ -Dloader.main=org.onap.aai.schema.GenTester -Dloader.path=-
/src/main/resources -Dschema.ingest.file=src/main/resources/application.properties -jar target/aai-graphadmin-*jar

```

You should see the following output:

```

---- NOTE --- about to open graph (takes a little while)-----
-- loading schema into JanusGraph
-- loading schema into JanusGraph
-- Loading new schema elements into JanusGraph --
-- graph commit
-- graph shutdown

```

You can check the logs to see if the graph elements were created successfully and grep for your propertyd logs  
/createDBSchema/;  
grep 'new-widget-name' metrics.log

```

**22. Start the "resources" microservice**

- a. Resources runs on port 8447. Go to the resources directory  
`$ cd ~/LF/AI/resources`
- b. Set the debug port to 9447  
`$ export MAVEN_OPTS="-Xms1024m -Xmx5120m -XX:PermSize=2024m -Xdebug -Xnoagent -Djava.compiler=NONE -Xrunjdwp:transport=dt_socket,address=9447,server=y,suspend=n"`
- c. Start the microservice  
`$ mvn -pl aai-resources -P runAjsc -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT`  
 Should see something like this: Resources Microservice Started

**23. Start the "traversal" microservice**

- a. Traversal runs on port 8446. Go to the traversal directory  
`$ cd ~/LF/AI/traversal`
- b. Set the debug port to 9446  
`$ export MAVEN_OPTS="-Xms1024m -Xmx5120m -XX:PermSize=2024m -Xdebug -Xnoagent -Djava.compiler=NONE -Xrunjdwp:transport=dt_socket,address=9446,server=y,suspend=n"`
- c. Start the microservice  
`$ mvn -pl aai-traversal -P runAjsc -Daai.core.version=0.0.1-TEST-SNAPSHOT -Daai.schema.version=0.0.1-TEST-SNAPSHOT`  
 Should see something like this: Traversal Microservice Started

**24. Get an example newWidget using "New Widget Example" (find these examples in this postman collection: [New-Widget Example](#), [postman\\_collection.json](#))**

The screenshot shows the Postman interface with the 'New Widget Example' collection selected. The 'GET' request for `https://127.0.0.1:8443/aai/v11/examples/new-widget` is highlighted. The response body contains the following XML:

```

<?xml version="1.0" encoding="UTF-8"?>
<new-widget xmlns="http://org.opencom.aai.inventory/v11">
  <new-widget-name>example-new-widget-name-val-43832</new-widget-name>
  <new-widget-type>example-new-widget-type-val-75449</new-widget-type>
  <model-invariant-id>example-model-invariant-id-val-30141</model-invariant-id>
  <model-version-id>example-model-version-id-val-30141</model-version-id>
  <new-widget-id>example-new-widget-id-val-31733</new-widget-id>
</new-widget>

```

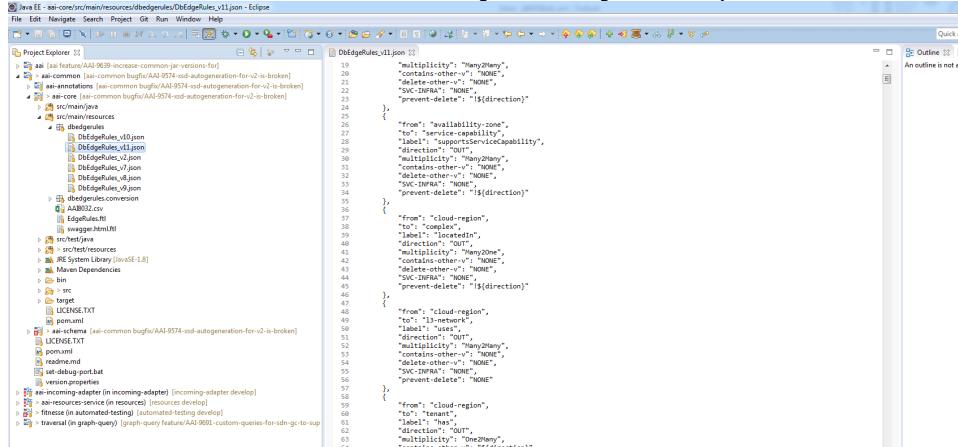

**25. Copy the new widget and PUT it: (PUT New Widget)**

The screenshot shows the Postman interface with the 'PUT New Widget' request selected. The URL is `https://127.0.0.1:8443/aai/v11/network/new-widgets/new-widget/example-new-widget-name-val-43832`. The response body contains the same XML as the previous screenshot, indicating the new widget has been successfully created.

**26. Success! We have updated an existing object type and added a new object type. Next, we will set up an edge between the CloudRegion and the NewWidget**

- ## 27. Open DbEdgeRules\_v11.json

File is aai-common/aai-core/src/main/resources/dbedgerules/DbEdgeRules\_v11.json

28. Add a new EdgeRule, allowing an edge between the CloudRegion and NewWidget:

```
{  
    "from": "cloud-region",  
    "to": "tenant",  
    "label": "has",  
    "direction": "OUT",  
    "multiplicity": "One2Many",  
    "contains-other-v": "${direction}",  
    "delete-other-v": "NONE",  
    "SVC-INFRA": "!" + ${direction},  
    "prevent-delete": "${direction}"  
},  
  
{  
    "from": "cloud-region",  
    "to": "new-widget",  
    "label": "has",  
    "direction": "OUT",  
    "multiplicity": "One2Many",  
    "contains-other-v": "NONE",  
    "delete-other-v": "NONE",  
    "SVC-INFRA": "NONE",  
    "prevent-delete": "NONE"  
},
```

This means cloud-region connects to new-widget, edge label is "has", it's an OUT edge, one cloud region can have multiple edges to new-widgets, cloud-region does not contain new-widget, new-widget will not be deleted when the cloud-region connected to it is deleted, it is not SVC\_INFRA type, and having an edge to a new-widget will not prevent deletion of the cloud-region.

29. Save the file, and rebuild aai-common, resources, and traversal. Start resources and traversal microservices.

30. Create a cloud region with a relationship to the new-widget that was created earlier: (PUT Cloud-Region related to New-Widget)

The screenshot shows the Postman application interface. The left sidebar lists various collections and requests. The main area shows a PUT request to the URL `https://127.0.0.1:8443/aai/v1/cloud-infrastructure/cloud-regions/cloud-region/example-cloud-owner-val-44086/ex...`. The request body contains XML code defining a cloud region with a relationship to a new widget. The response status is 201 Created, and the time taken is 3489 ms.

```

<cloud-region>
  <owner-defined-type>example-owner-defined-type-val-38571</owner-defined-type>
  <cloud-region-version>example-cloud-region-version-val-138</cloud-region-version>
  <cloud-zone>example-cloud-zone-val-97516</cloud-zone>
  <owner>example-owner-val-38571</owner>

  </relationship>
</cloud-region>

```

31. GET the new-widget object: (GET New Widget)

The screenshot shows the Postman application interface. The left sidebar lists various collections and requests. The main area shows a GET request to the URL `https://127.0.0.1:8443/aai/v11/network/new-widgets/new-widget/example-new-widget-name-val-43832`. The request body contains XML code representing the new widget object, including its relationships to a cloud region. The response status is 200 OK, and the time taken is 123 ms.

```

<new-widget>
  <owner>http://openapi.aai.inventory/v11</owner>
  <new-widget-name>example-new-widget-name-val-43832</new-widget-name>
  <new-widget-type>example-new-widget-type-val-75449</new-widget-type>
  <model-invariant-id>example-model-invariant-id-val-76594</model-invariant-id>
  <model-invariant-id>example-model-invariant-id-val-76594</model-invariant-id>
  <new-widget-id>example-new-widget-id-val-51573</new-widget-id>
  <relationships>
    <relationship>
      <related-to>cloud-region</related-to>
      <relationship-data>
        <relationship-key>cloud-region-owner</relationship-key>
        <relationship-value>example-cloud-owner-val-44086</relationship-value>
      </relationship-data>
      <relationship>
        <relationship-key>cloud-region</relationship-key>
        <relationship-value>example-cloud-region-id-val-67393</relationship-value>
      </relationship>
      <relationship>
        <relationship-key>cloud-region</relationship-key>
        <relationship-value>example-cloud-region-id-val-67393</relationship-value>
      </relationship>
      <relationship>
        <relationship-key>cloud-region</relationship-key>
        <relationship-value>example-cloud-region-id-val-67393</relationship-value>
      </relationship>
    </relationship>
  </relationships>
</new-widget>

```

32. Notice that when GETting the new-widget object it shows the relationship to the cloud-region.

We have successfully modified the schema and edge rules to update an existing type, create a new type, and define an edge relationship which allows for a new-widget type to be connected to a cloud-region.
