

# OOM meeting notes - 2017-09-27

## Agenda:

- Updates on OOM development
  - Global state is that all containers are deployable with OOM. AAF was completed. DCAEg2 deployer onboarded as well.
- OOM vs Amsterdam release
  - Pushing for OOM to be part of the Amsterdam release. Worst case OOM will be part of Amsterdam 1.2.0 release,.
- M4 (code freeze) readiness
  - Question: who is creating the Beijing branches?
  - Jenkins job in progress to clear the "Nexus binary" blocker
- Questions
  - Should we externalize common values from YAML to have centralized place to have common default values?
    - One key requirements: need to make sure that each project is independent.
      - The current proposal allows each individual project or deployment to override a parent value
      - HELM allows to override default values. A good example could be that there is a default image (staging-latest) but that any project could override the default image with a specific version.
  - There are inconsistencies in the way image references are made (1 line vs split)
    - helm recommendation is to split
    - we will create bugs in JIRA to track and fix the inconsistent references
- David from Orange will work with the Integration team to run the OOM project within the Integration team. First objective is to have a CI integration with ONAP, OOM and OPNFV. [Mike Elliott](#) offered to help. He setup OOM in the Integration environment.
  - There is a project within OPNFV to install k8s on bare metal
  - Recommendation for David: install a local Nexus server to avoid long download times
- [F Michael O'Brien](#) is attending a [meeting for OPNFV](#) every monday to discuss [OOM integration](#). [David Sauvageau](#) and [David Blaisonneau](#) to be added to the list by [F Michael O'Brien](#)
- OOM documentation has been officially added to readthedocs.io.
- Consul is now running and available to do health checks on many of the components. The overall health check is targeted for Beijing release.
- Next Steps
  - Formalize the scope for Beijing release. Overall goal for OOM/Beijing is to allow for PRODUCTION (robustness, auto-healing, scaling, etc) and ease of operations.
