- [Remote Debugging](#)

## Setting Up Your Development Environment

Start by following the page [Setting Up Your Development Environment](#), this covers items such as signing up for a linux foundation account, configuring git, installing gerrit and IDE recommendations.

## Downloading the Source Code

### Downloading SDN-C Projects

Follow steps in [Get git command from ONAP gerrit](#) to get the *git clone* command and clone each of the following SDNC projects:

Project Name	Project Description	has code
<a href="#">sdnc/adaptors</a>	SDN-C adaptors	—
<a href="#">sdnc/architecture</a>	SDN-C architectural artifacts (e.g. blueprints)	—
<a href="#">sdnc/core</a>	SDN-C core platform	—
<a href="#">sdnc/features</a>	SDN-C Karaf features	—

<a href="#">sdnc/northbound</a>	SDN-C northbound adaptors	✓ java
<a href="#">sdnc/oam</a>	SDN-C OA&M tools	✓ bash, javascript, python, DGs
<a href="#">sdnc/parent</a>	Parent POMS to be used by SDN-C components	—
<a href="#">sdnc/plugin</a>	SDN-C plugins	—

**Note:** The ONAP SDN-C projects are more like a demo version of ECOMP's SDN-GC.

## Downloading CCSDK Projects

Follow steps in [Get git command from ONAP gerrit](#) to get the *git clone* command and clone each of the following CCSDK projects:

Project Name	Project Description	has code
<a href="#">ccsdk/dashboard</a>	Operations Manager Dashboard	✓
<a href="#">ccsdk/distribution</a>	CCSDK distribution packaging (e.g. docker containers)	—
<a href="#">ccsdk/parent</a>	Parent POMS to be used by CCSDK clients	—
<a href="#">ccsdk/platform/blueprints</a>	Blueprints. <b>not in Amsterdam release</b>	—
<a href="#">ccsdk/platform/nbapi</a>	Northbound API	✓
<a href="#">ccsdk/platform/plugins</a>	Platform plugins	✓
<a href="#">ccsdk/sli/adaptors</a>	Common adaptors for use by directed graphs	✓
<a href="#">ccsdk/sli/core</a>	Core Service Logic Interpreter classes	✓
<a href="#">ccsdk/sli/northbound</a>	Common northbound APIS related to service logic interpreter	✓
<a href="#">ccsdk/sli/plugins</a>	Common plugins used by directed graphs	✓ python
<a href="#">ccsdk/storage/esaas</a>	Elastic Storage as a Service. <b>not in Amsterdam release</b>	—
<a href="#">ccsdk/storage/pgaas</a>	PGAAS (PostgreSQL as a Service)	✓ java, python, bash
<a href="#">ccsdk/utils</a>	Utilities	✓ bash, yaml

## Get git clone Command from ONAP gerrit

The below instructions explain how to clone a repository from gerrit with the commit message hook included and it will be configured to use HTTPS. SSH is still the recommended protocol, these instructions serve as a workaround for users behind restrictive networking rules.

If you have worked on other projects in gerrit and are already familiar with cloning from gerrit you can ignore these instructions!

### Check this only once

This should have been done as part of "Setting Up Your Development Environment" and is only needed if you are behind a proxy and plan to use HTTP.

If behind proxy, ensure git config has set http.proxy and https.proxy NVPs,

check with the following command:

```
git config -l
```

if no http/https proxies exist add them with the following commands:

```
git config --add http.proxy <your-proxy-http-url>
```

```
git config --add https.proxy <your-proxy-https-url>
```

here's an example:

```
git config --add http.proxy http://<user-id>:<password>@11234.proxy.com:8080
```

```
git config --add https.proxy https://<user-id>:<password>@11234.proxy.com:8080
```

Use your linux foundation account to login onto [ONAP projects](#).

Get Project list by entering the project key name in the **Filter**, for example **sdnc**, this list of projects under sdnc will be shown as below:

The screenshot shows the ONAP Gerrit Code Review interface. The browser address bar displays <https://gerrit.onap.org/r/#/admin/projects/?filter=sdnc>. The page header includes the ONAP logo and navigation links. The main content area shows a list of projects under the 'sdnc' filter. The table below represents the data shown in the screenshot.

S	Project Name	Project Description	Repository Browser
Q	sdnc/adaptors	SDNC adaptors	(gitweb)
Q	sdnc/architecture	SDNC architectural artifacts (e.g. blueprints)	(gitweb)
Q	sdnc/core	SDNC core platform	(gitweb)
Q	sdnc/features	SDNC Karaf features	(gitweb)
Q	sdnc/northbound	SDNC northbound adaptors	(gitweb)
Q	sdnc/oam	SDNC OA&M tools	(gitweb)
Q	sdnc/parent	Parent POMs to be used by SDNC components	(gitweb)
Q	sdnc/plugins	SDNC plugins	(gitweb)

To view the code through gerrit client, first follow steps in [Get git command from ONAP gerrit](#) to get the Projects list page.

Then, choose either one of the following option to view the code of the desired project.

### Option 1: View Through "gitweb" Option in Project List Page

**Note:** this option will bring you to, and only to, the HEAD branch which is the master branch.

In the project list page, click on the *gitweb* under the *Repository Browser* column of your project row.

Now, the repo details page will be shown and you can view the code in master branch from there.

## Compiling

### Maven

#### Version has to be version greater or equal to 3.3.3

Ensure your maven is installed / set up as per instruction from [Maven](#) section of [Setting Up Your Development Environment](#) page.

### File settings.xml

#### Get settings.xml file

Following instruction from [Maven Example settings.xml](#) section of [Setting Up Your Development Environment](#) page to get your settings.xml file.

#### Just to emphasis

If behind proxy,

**Add proxy definition under proxies block, if under proxy**

```

1 <proxy>
2   <id>optional</id>
3   <active>true</active>
4   <protocol>http</protocol>
5   <host>11234.proxy.com</host>
6   <port>8080</port>
7   <nonProxyHosts>local.net | localhost | 127.0.0.1</nonProxyHosts>
8 </proxy>

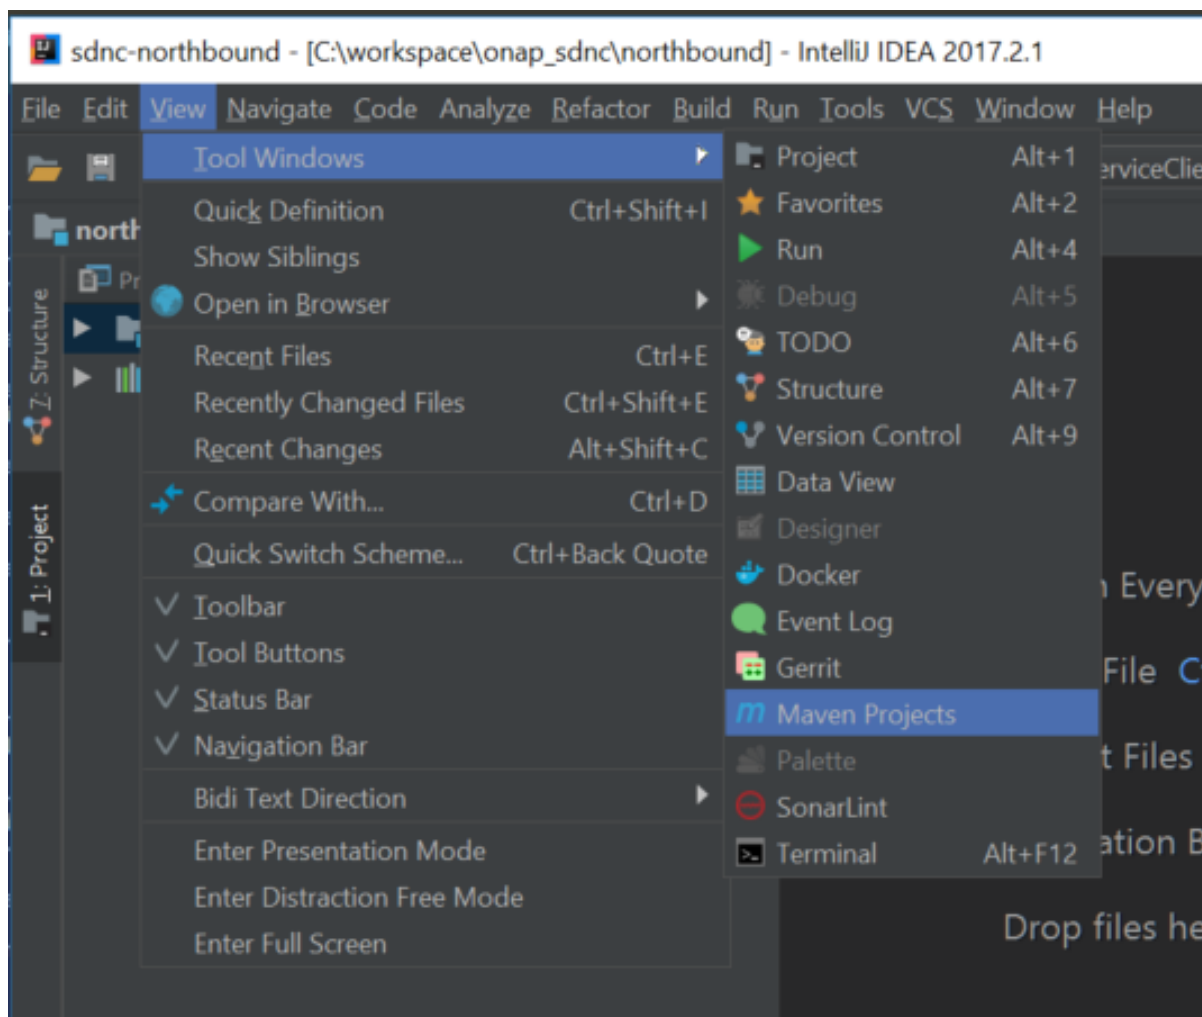

```

### Configure settings file in IntelliJ

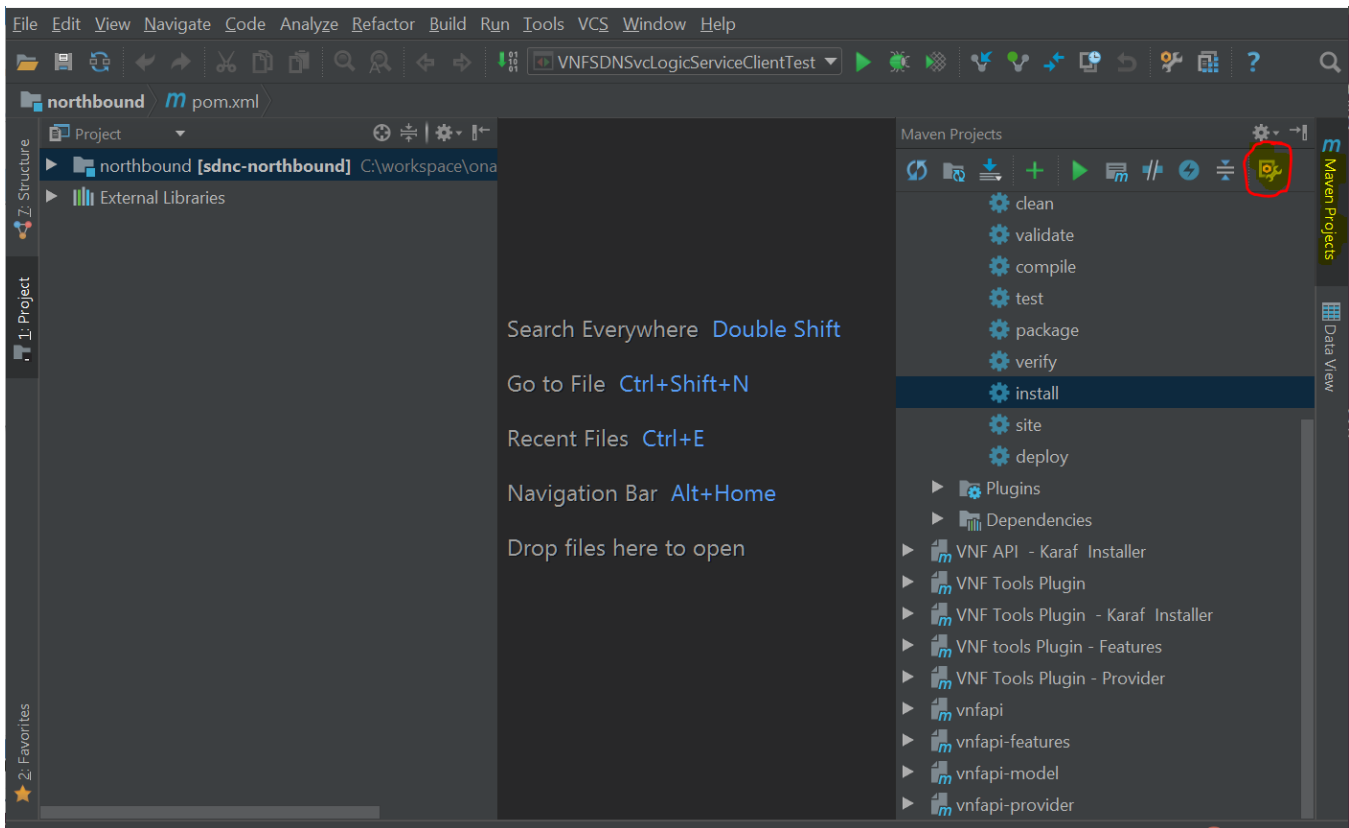

If you are going to compile with IntelliJ, follow steps in this section to configure settings.xml file in IntelliJ.

If you did not make your *Maven Project* by default shown, do the following:

In IntelliJ, Select **View -> Tool Windows -> Maven Project**

The maven project will shown on the right side of the IntelliJ window.

Click the *Maven Settings* wrench to bring up the **Settings** window:

Select the *Override* of the **User settings file**, add the settings.xml file full path, the **Apply** button will be enabled. click on **Apply** to apply the change.

## Build The Code

### Projects Build Order

The SDN-C projects repositories should be built in the following order:

- sdnc/core
- sdnc/adaptors
- sdnc/northbound
- sdnc/plugins
- sdnc/oam

## Run Maven Build

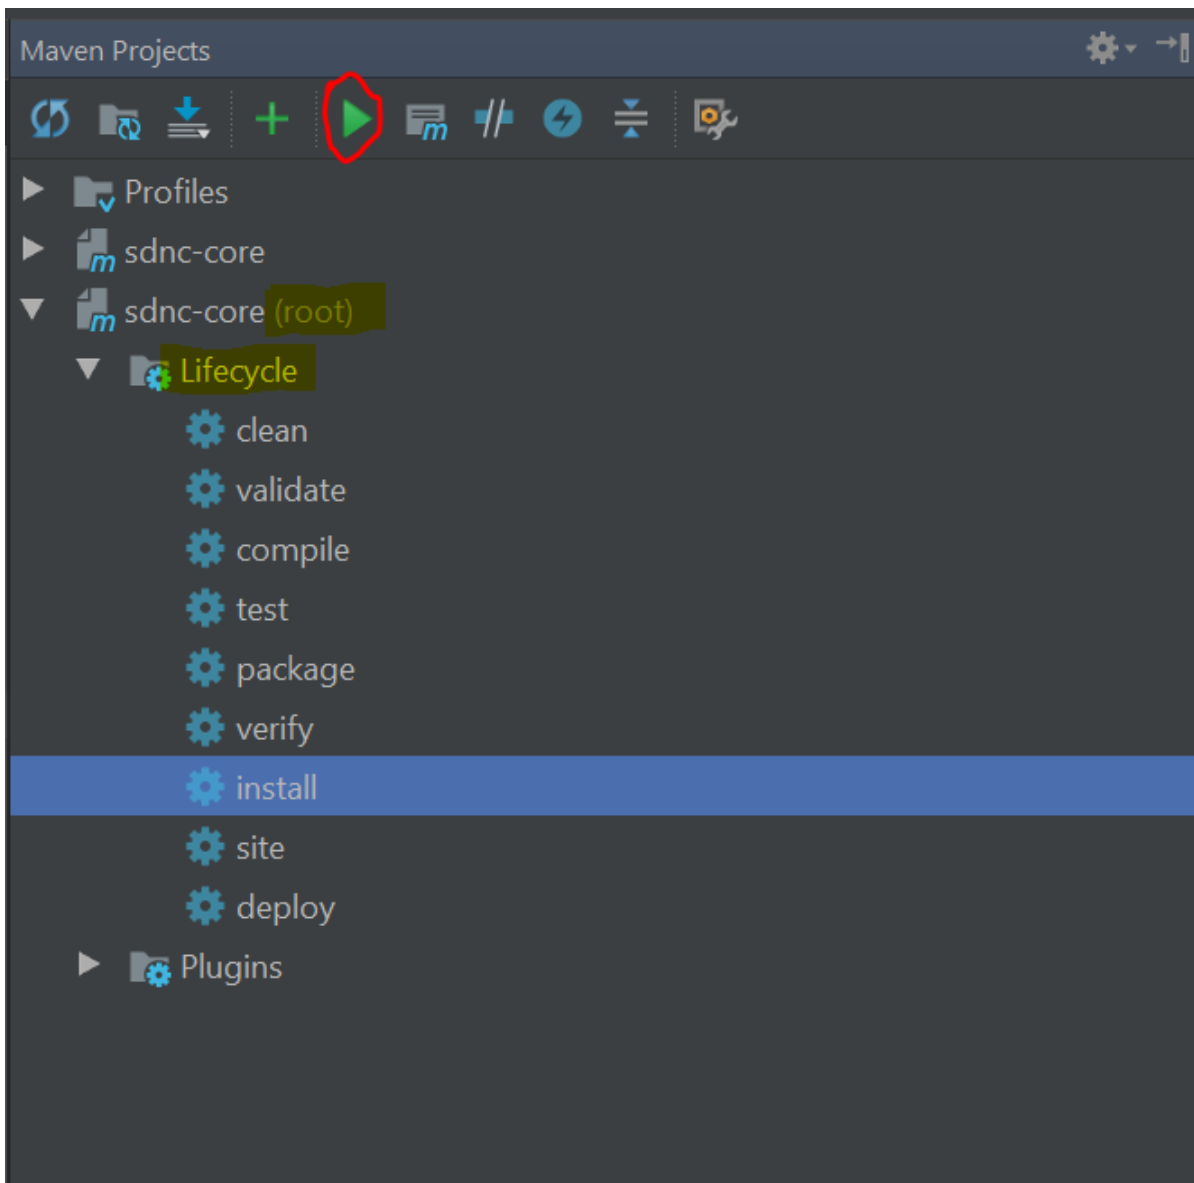

### Build From Command Line

Under the directory where your clone code is, run the following command to build the project

```
mvn clean install -s <the settings.xml file with full path>
```

### Build Within IntelliJ

From IntelliJ *Maven Projects* window, find the module marked with **(root)**, expand it by clicking on the triangle on the left side or double clicking the text. It will then show two folders : *Lifecycle* and *Plugins*. Use the same way to expand the *Lifecycle* folder, the build options are now shown:

To run the build, double click the **Install** or select **install** and then click on the **Run Maven Build** triangle icon.

To do clean, double click the **clean** or select **clean** and then click on the **Run Maven Build** triangle icon.

## Tips

### Skip Maven Javadoc Build

In the case, maven javadoc compilation failing which causes build process abort. To continue build the code, we need to skip the maven javadoc compilation.

#### From command line

add the "maven.javadoc.skip=true" in the command line build command as the following:

```
mvn clean install -Dmaven.javadoc.skip=true -s <the settings.xml file with full path>
```

#### From pom file

add the following property definition:

##### POM file property to skip Maven JAVADOC build

```
<properties>

    <maven.javadoc.skip>true</maven.javadoc.skip>

</properties>
```

## Unit Testing

### Definition of Good Unit Test

Before start writing unit test, it's important that there's a common definition of what a good unit test is.

From the official site of Roy Osherove's book [The Art of Unit Testing](#):

*A unit test is an automated piece of code that invokes a unit of work in the system and then checks a single assumption about the behavior of that unit of work.*

In SDN-C project, the **unit of work** is being defined as Java Method and a "**good**" Unit Test:

- Is fully automated, integrated with the build process, executes fast, and can be run in any order.
- Executes a specific service flow through a Java method with a known expected result based on the input parameters provides.
- Executes in isolation and doesn't interact with any external methods.
- Executes in memory and does not interact with any external systems, files or databases.
- Consistently return the same result and the result can be trusted. It's Reliable, Repeatable, and Deterministic.

### Unit Test Best Practices

- **Arrange, Act, and Assert**
  - Arrange everything you need for the Unit Test.
  - Act invokes the method under test and captures the results.
  - Assert represents the act of testing, it compares the actual result against the expected result. Assert(s) must be present to have a valid unit test.
- **Assert The Results Are Correct**
  - The Unit Test expects a result based on input and asserts it.
  - Simply testing that no exception has been thrown is not enough.
  - Avoid the common mistake of testing all of the functionality in one test case.
- **Use a Naming Convention for Test Cases**
  - Follow the shared naming convention when naming test cases.
  - Standards increase maintainability, readability and visibility.
- **Avoid Test Interdependence**
  - Each test should handle its own setup and tear down.
  - Do not maintain state information between test cases
- **Keep Test Short, Sweet, and Visible**
  - You want the test setup logic to be visible at a glance.
  - Unit test code should be concise

- When a unit test fails you want to quickly and easily see what went wrong.

## Unit Test Coverage

When determining what to unit test there are several key principles to keep in mind.

- Unit tests should verify business logic.
- Unit tests should be written that verify your code behaves as expected in "normal" scenarios as well as in more "unexpected" scenarios, like boundary conditions or error conditions (null or missing input values)
- Every time a bug is reported unit tests should be created or enhanced for the faulty code
- Do not unit test trivial code like getters and setters.
- Do not unit test external frameworks or application library functions, assume they work.
- Do not unit test database operations, assume they work when the database is available.

Java code coverage can be measured using an external tool such as JaCoCo which ONAP sonar build is using.

## JUnit Test

JUnit is the unit test framework used for testing Java. It is recommend to use Junit4 and Mockito to write the junit tests.

### JUnit Unit Test Naming Conventions

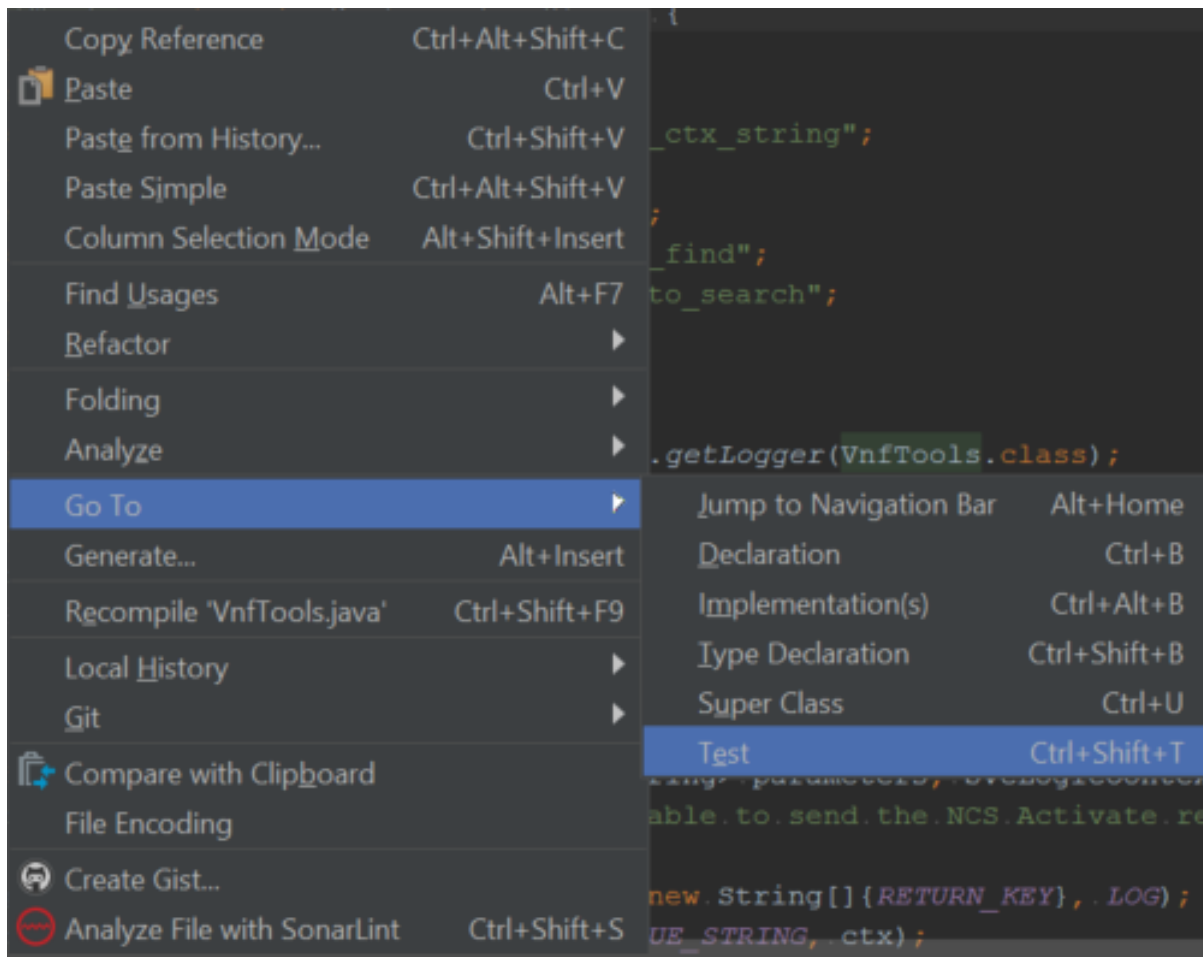

- The name of the test class should be the name of the class it is testing plus the word Test.
  - For example, class *MyClass.java* has test class *MyClass**Test**.java*.
- The name of a test should contain the name of the method being tested, scenario and expected output.
  - For example, test *createCustomerWithNoNameRaisesException* would be a test which is testing the method *createCustomer*, it tries to do so without providing a name so an exception should be raised.

### Create JUnit Test in IntelliJ

This applies to both creating brand new JUnit Test class or navigating to existing test class to add new additions.

Open the class that you are going to write JUnit test for in IntelliJ.

In anywhere of this class editor, do **Ctrl+Shift+T** or right click to bring up right click menu, then select *Go To*, then *Test* in the cascaded menu:

This will bring up the *Choose Test for...* window as below.

Choose *Create New Test...* for creating brand new JUnit Test, or just choose the test class to go to the existing tests.

When *Create New Test...* is selected, the *Create Test* window will be brought up:

Create Test

Testing library:

JUnit4

Class name:

VnfToolsTest

Superclass:

Destination package:

org.onap.sdnc.vnftools

Generate:

☐ setUp/@Before  
☐ tearDown/@After

Generate test methods for:

☐ Show inherited methods

	Member
	checkIfActivateReady(parameters:Map<String, String>, ctx:SvcLogicContext):void
	stringContains(parameters:Map<String, String>, ctx:SvcLogicContext):void
	generateName(parameters:Map<String, String>, ctx:SvcLogicContext):void
	printContext(parameters:Map<String, String>, ctx:SvcLogicContext):void
	getArrayLength(ctx:SvcLogicContext, key:String):int
	getArrayLength(ctx:SvcLogicContext, key:String, debug:String):int

?

OK

Cancel

The test **Class name** is automatically generated and shown in the window. Ensure the **Testing library** is selected with *JUnit4*.

Select

- *setUp* and *tearDown* for automatically generated setUp and tearDown methods block for each test case set up and tear down.
- the methods under **Generate test methods for** to automatically generate test method block for that method.

Click **OK** button, once you completed your selection/set up in the *Create Test* window.

It will bring you to the edit page of the new test class.

## Add Dependency to POM File

If the Junit and mockito dependencies are not in the module and its parent pom file, add them to the module's pom.xml file. A sample snippet is below:

### JUnit dependencies in POM file

```
<dependency>
  <groupId>junit</groupId>
  <artifactId>junit</artifactId>
  <version>${junit.version}</version>
  <scope>test</scope>
</dependency>
<dependency>
  <groupId>org.mockito</groupId>
  <artifactId>mockito-core</artifactId>
  <version>${mockito.version}</version>
  <scope>test</scope>
</dependency>
```

## Mock Class Level Attributes

More about how to use Mockito can be found from [Mockito Tutorial](#).

Sometimes you do want to set/get class level attributes to satisfy complex test code and still keep the test coverage in sonar achievable, [Whitebox](#) of package *org.mockito.internal.util.reflection* could be used to do code reflection.

static <code>Object</code>	<code>getInternalState(Object target, String field)</code>
static void	<code>setInternalState(Object target, String field, Object value)</code>

## Issue With Using PowerMockito

There are multiple advantages of using PowerMockito to easily write the junit test.

However, we don't recommend to use Powermockito, due to the issue of [Jacoco is not compatible with PowerMockito](#).

# Committing Code

## Install git-review

To commit code to ONAP, you must have git-review installed. The steps in this section only need to be done one time, except the Tips 😊. This should have been done already during [Setting Up Your Development Environment](#).

## On Linux

run the following command to check if *git-review* is installed as part of your OS image.

```
git-review
```

If not the following command to install the *git-review*.

```
sudo apt install git-review
```

here's an example:

### install git-review on Linux

```
ubuntu@beili-ws-01:~/Videos$ git-review
```

The program 'git-review' is currently not installed. You can install it by typing:

```
sudo apt install git-review
```

```
ubuntu@beili-ws-01:~/Videos$ sudo apt install git-review
```

## On Windows

### must have git installed

If you do not have git installed, following *Install Git on Windows* at [atlassian's tutorials for installing git](#) to

- download the [Git for Windows installer](#)
- start installer and follow **Git Setup** wizard screen **Next** until **Finish** prompts to complete the installation.

### must have python installed

If you do not have python installed, following [Python & pip Windows installation](#) to

- download [Python window installer](#)
- start installer and *select Add Python to PATH* option

### install git-review using pip

Open a *git bash terminal* by

- going to the *bin* directory under your *git* installed directory (for example, *C:\Program Files\Git\bin* directory ),
- run *bash.exe*

In the git bash terminal, run the following command to install git-review

```
|
```

```
c:/Python27/Scripts/pip2.7 install git_review --proxy <your proxy>
```

## Set Git Remote Gerrit

Check your git remote setting, use the following command

```
git remote -v
```

Here's an example of output:

### git remote output

```
C:\workspace\onap_sdnc\northbound>git remote -v
gerrit http://beiliz@gerrit.onap.org/r/a/sdnc/northbound (fetch)
gerrit http://beiliz@gerrit.onap.org/r/a/sdnc/northbound (push)
origin http://beiliz@gerrit.onap.org/r/a/sdnc/northbound (fetch)
origin http://beiliz@gerrit.onap.org/r/a/sdnc/northbound (push)
```

If the *gerrit* does not exist, you need to set it up with the following command:

```
git remote add gerrit <the link of the origin>
```

**Note:** the remote origin is added automatically after git clone of the repo. The gerrit link is the same as the origin's, hence, we just directly use it.

## Set Git Config

Use the following command to check your git config:

```
git config -l
```

Ensure that you have the following configuraiton set properly:

GIT Config Key	Expected Value	Setting Command
core.eol	lf	git config --global core.eol lf
core.autocrlf	true	git config --global core.autocrlf true
user.name	your name	git config --global user.name <your name>
user.email	your email address	git config --global user.email <your email address>

## Creating A Review

Checkout the master branch, work on your changes, once you are ready for submission, do the following to create a review.

1. Ensure your workspace is clean and up-to-date

Use the following command to check all the changes in the master branch

```
git status
```

Ensure

- your branch is up-to-date with the origin/master
  - do a *git pull* to get the latest master code
- all the changed files are the ones you wanted to submit.
  - remove any un-wanted files

2. Run the following commands in the listed order to create a review

Steps	Command	Notes
-------	---------	-------

1	<code>git commit -sam &lt;comment summary&gt;</code>	Commit summary should not exceed 50 char. See <a href="#">ONAP Commit Messages</a> for more details.
2	<code>git log --shortstat</code>	<p>To ensure change lines are properly done and your commit has the following:</p> <ul style="list-style-type: none"> <li>◦ Change-Id</li> <li>◦ Signed-off-by</li> </ul> <p>Here's an example:</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p><b>git log --shortstat</b></p> <pre>C:\workspace\onap_sdnc\northbound&gt;git log --shortstat commit 4728eada855f9162030f5b46a2513e3dbffa757c Author: beili.zhou &lt;beili.zhou@amdocs.com&gt; Date: Fri Oct 13 19:19:11 2017 -0400  Sonar coverage vnfapi -VNFSDNSvcLogicServiceClient  Add Junit test case for VNFSDNSvcLogicServiceClient In VNFSDNSvcLogicServiceClient: - Fix sonarlint issues (remove un-used import and etc) - Changed tab to 4 spaces as per ONAP Java code style  Issue-Id: SDNC-123 Change-Id: Id176e915f17ef5fab6805415f92d60b4c8e95b2 Signed-off-by: beili.zhou &lt;beili.zhou@amdocs.com&gt;  2 files changed, 580 insertions(+), 240 deletions(-)</pre> </div> <p>If the <b>Change-Id</b> does not exist, do not proceed. You need to following <a href="#">Fix no change-id</a> to fix it before proceeding further.</p>
3	<code>git commit --amend</code>	<p>Use this command to do the following:</p> <ul style="list-style-type: none"> <li>◦ add more description about this commit (refer to <a href="#">Commit Messages</a> for how to organize commit description)</li> <li>◦ insert <i>Issue-Id: &lt;your ONAP issue id&gt;</i> before the <i>Change-Id</i></li> </ul>
4	<code>git review</code>	<p>This command will create the review at Gerrit.</p> <p>Once this command is completed, your newly created review can be found from <b>Outgoing reviews</b> in <a href="#">Gerrit self dashboard</a> .</p>

### 3. Update the Gerrit Review to get ready

From [Gerrit self dashboard](#), click your newly created review, it will bring up the review details.

Click the **Add** button in the *Reviewers* section, to add reviewers (who is going to review your code) and committers (who is going to review your code as well as approve and commit your code).

Owner

Beili Zhou ?

Reviewers

ONAP Jobbuilder

Add...

Project

sdnc/northbound

Branch

master

Topic

Updated

2 weeks ago

Cherry Pick

Revert

Note:

- The *ONAP Jobbuilder* will be added automatically within one or two minutes after the review created, and a verify build will also be automatically triggered for your review in ONAP jenkins server.
- The committer can be found from *Software Defined Newtork Controller* section in [Resources and Repositories \(Deprecated\)](#) page.

By now, you will just wait and check your email for information of

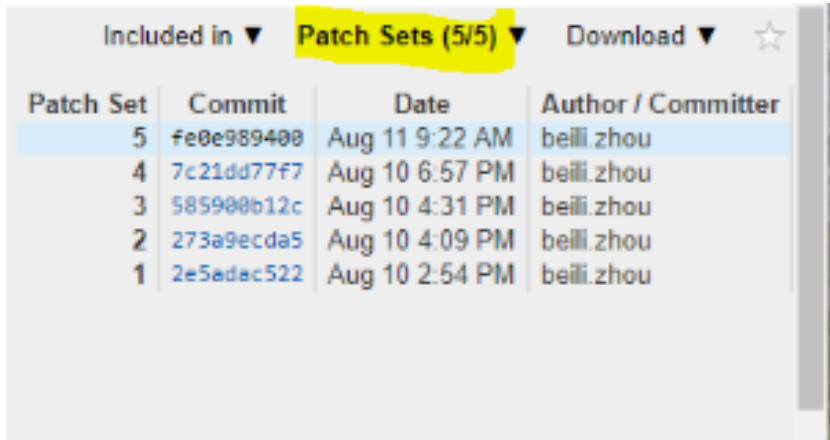

- If the verify jenkins build is passed for your review
  - If it is passed, *ONAP Jobbuilder* will add a **+1** to the *Verified* field in your review.
- If there's any comments in your review
  - the comments details can be view from the **History** section by clicking on the description or *Expand All* button
- If your review has been merged
  - If your review is merged or in process to be merged, you will see in the *Code-Review* field, you have a **+2** from one of the committer you have added in your *Reviewers*.

## Tips

### How to Change the Comments in a Review

Oops, I made a mistake in my review comments. It cannot be changed in the gerrit review. 😞

Go back to your workspace, and do the following to change the comments of your existing review.

Steps	Command	Notes																								
1	git commit --amend	update the comment as desired																								
2	git log --shortstat	validate your commit now has the updated comments, as well as the <b>Change-Id</b> as the one in the gerrit review																								
3	git review	<p>push the changed comment to the review again.</p> <p>Once the command is completed, go to your review, you will see</p> <ul style="list-style-type: none"><li>• the comments content adjust to your new ones</li><li>• the <i>Patch Sets</i> is now increased by one, such as from (1/1) to (2/2). here's an example:</li></ul>  <table><tr><th>Patch Set</th><th>Commit</th><th>Date</th><th>Author / Committer</th></tr><tr><td>5</td><td>fe0e989400</td><td>Aug 11 9:22 AM</td><td>belli.zhou</td></tr><tr><td>4</td><td>7c21dd77f7</td><td>Aug 10 6:57 PM</td><td>belli.zhou</td></tr><tr><td>3</td><td>585900b12c</td><td>Aug 10 4:31 PM</td><td>belli.zhou</td></tr><tr><td>2</td><td>273a9ecda5</td><td>Aug 10 4:09 PM</td><td>belli.zhou</td></tr><tr><td>1</td><td>2e5adac522</td><td>Aug 10 2:54 PM</td><td>belli.zhou</td></tr></table>	Patch Set	Commit	Date	Author / Committer	5	fe0e989400	Aug 11 9:22 AM	belli.zhou	4	7c21dd77f7	Aug 10 6:57 PM	belli.zhou	3	585900b12c	Aug 10 4:31 PM	belli.zhou	2	273a9ecda5	Aug 10 4:09 PM	belli.zhou	1	2e5adac522	Aug 10 2:54 PM	belli.zhou

### How to Update the Code in a Review

Now, I got comments in my view, and I have made the code adjustment in my workspace and tested.

Follow the steps to push your new code changes to the your existing reiew.

Steps	command	notes
1	git commit -sam "my updated code"	To create a new commit with your updated code
2	git log --shortstat	<p>you will see the most 2 recent commits are from</p> <ul style="list-style-type: none"><li>• your commit from step 1</li><li>• your original commit of the existing review</li></ul>

3	git rebase -i HEAD~2	<p>To run rebase interactively for the most recent 2 commits</p> <p>In the interactive mode, it will bring up the text which contains <b>pick</b> for your last 2 commits along with the following content:</p> <pre># # Commands: # p, pick = use commit # r, reword = use commit, but edit the commit message # e, edit = use commit, but stop for amending # s, squash = use commit, but meld into previous commit # f, fixup = like "squash", but discard this commit's log message # x, exec = run command (the rest of the line) using shell # # These lines can be re-ordered; they are executed from top to bottom. # # If you remove a line here THAT COMMIT WILL BE LOST. # # However, if you remove everything, the rebase will be aborted. # # Note that empty commits are commented out</pre> <p>Do the following:</p> <ul style="list-style-type: none"><li>• replace the <b>pick</b> in the start line of your commit from step 1 (marked with "my updated code") with <b>s</b> or <b>squash</b>,</li><li>• remove any other text line related to this commit in the line below.</li><li>• save the change by entering <b>:wq</b></li></ul> <p>Once this command is completed, 2 commits will be merged into 1 commit.</p>																								
4	git log --shortstat	<p>you will see there's only 1 commit which replaces the 2 commit you have seen in step 2.</p> <p>validate your commit has the <b>Change-Id</b> as the one in the gerrit review</p>																								
5	git review	<p>push the changed comment to the review again.</p> <p>Once the command is completed, go to your review, you will see</p> <ul style="list-style-type: none"><li>• the comments content adjust to your new ones</li><li>• the <i>Patch Sets</i> is now increased by one, such as from (1/1) to (2/2). here's an example:</li></ul> <div><div>Included in ▼ Patch Sets (5/5) ▼ Download ▼ ☆</div><table><tr><th>Patch Set</th><th>Commit</th><th>Date</th><th>Author / Committer</th></tr><tr><td>5</td><td>fe0e989400</td><td>Aug 11 9:22 AM</td><td>beili.zhou</td></tr><tr><td>4</td><td>7c21dd77f7</td><td>Aug 10 6:57 PM</td><td>beili.zhou</td></tr><tr><td>3</td><td>585900b12c</td><td>Aug 10 4:31 PM</td><td>beili.zhou</td></tr><tr><td>2</td><td>273a9ecda5</td><td>Aug 10 4:09 PM</td><td>beili.zhou</td></tr><tr><td>1</td><td>2e5adac522</td><td>Aug 10 2:54 PM</td><td>beili.zhou</td></tr></table></div>	Patch Set	Commit	Date	Author / Committer	5	fe0e989400	Aug 11 9:22 AM	beili.zhou	4	7c21dd77f7	Aug 10 6:57 PM	beili.zhou	3	585900b12c	Aug 10 4:31 PM	beili.zhou	2	273a9ecda5	Aug 10 4:09 PM	beili.zhou	1	2e5adac522	Aug 10 2:54 PM	beili.zhou
Patch Set	Commit	Date	Author / Committer																							
5	fe0e989400	Aug 11 9:22 AM	beili.zhou																							
4	7c21dd77f7	Aug 10 6:57 PM	beili.zhou																							
3	585900b12c	Aug 10 4:31 PM	beili.zhou																							
2	273a9ecda5	Aug 10 4:09 PM	beili.zhou																							
1	2e5adac522	Aug 10 2:54 PM	beili.zhou																							

## How to Fix a Commit which Does Not have a Change-Id

This would only happen when you are creating your very first review in a repo. It mainly because your workspace might have some mis-config which lead your repo clone was not done properly with the *Clone with commit-msg hook* option.

Follow the steps below to do the correction.

Steps	Command	Notes
1	git reset HEAD~1	to undo the commit

2	from <a href="#">github helper page</a> , download <a href="#">commit-msg</a> , and place it under your <repo>/git/hooks directory if your O/S adds and extension to the file, remove. It must be named "commit-msg"	set the proper commit-msg hook  this will set the <b>Change-Id</b> properly in your commit
3	Use your previous command to create the commit again	
4	git log --shortstat	to check the existence of <b>Change-Id</b>

## How to Find All of Your Merged Changes

You can find your recent merged changes from [Gerrit self dashboard](#), however, it only works for **Recent** changes.

To find all of your changes, you can type in "*is:closed(owner:self)*" in the *Search* field at [Gerrit self dashboard](#), then click on the *Search* button.

## Deployment

### Deploying a Minimal ONAP SDN-C Environment

This tutorial is based on ONAP-integration project<sup>[1]</sup> which utilizes Vagrant<sup>[2]</sup>, a deployment tool to build an ONAP environment.

The goal of this section is to guide how to quickly deploy a running ONAP SDN-C environment which is going to use the existed image in the ONAP Nexus3 server.

Actually it supports various automate deployment environment including compiling code with maven, building docker images as part of the deployment procedure.

#### ONAP-integration

"Integration framework, automated tools, code and scripts, best practice guidance related to cross-project Continuous System Integration Testing (CSIT), and delivery of ONAP."

### Setup

Tool	Version	Introduction
Vagrant	1.9.5	<a href="https://www.vagrantup.com/">https://www.vagrantup.com/</a>
Virtualbox	5.1.20	<a href="https://www.virtualbox.org/">https://www.virtualbox.org/</a>
Git	2.14.3	<a href="https://git-scm.com/">https://git-scm.com/</a>

(1) After installation, make sure that your system is restarted in order to let configuration be activated.

### Basic Installations

#### Windows 10

Download the exe of the following (from the link listed in the above table) and install:

- vagrant
  - [https://releases.hashicorp.com/vagrant/?\\_ga=2.74767696.373821479.1506869076-1225456615.1499750393](https://releases.hashicorp.com/vagrant/?_ga=2.74767696.373821479.1506869076-1225456615.1499750393)
- virtualbox
  - [https://www.virtualbox.org/wiki/Download\\_Old\\_Builds\\_5\\_1](https://www.virtualbox.org/wiki/Download_Old_Builds_5_1)
- git
  - <https://git-scm.com/downloads>

## Ubuntu 16.04

Do the following:

- [Install virtualbox](#)
- [Create Virtualbox "vboxnet0" Host-only networking](#)
- [Install vagrant](#)
- [Install git](#)

Install virtualbox

Add the following line to your `/etc/apt/sources.list`:

```
deb http://download.virtualbox.org/virtualbox/debian xenial contrib
```

Run the command below

```
wget -q https://www.virtualbox.org/download/oracle_vbox_2016.asc -O- | sudo apt-key add -
wget -q https://www.virtualbox.org/download/oracle_vbox.asc -O- | sudo apt-key add -
sudo apt-get update
sudo apt-get install virtualbox-5.1
```

Create Virtualbox "vboxnet0" Host-only networking

On windows installation this may have been created already.

See "[https://www.virtualbox.org/manual/ch06.html#network\\_hostonly](https://www.virtualbox.org/manual/ch06.html#network_hostonly)"

```
VBoxManage hostonlyif create
```

Install vagrant

```
wget https://releases.hashicorp.com/vagrant/1.9.5/vagrant_1.9.5_x86_64.deb
sudo dpkg -i vagrant_1.9.5_x86_64.deb
```

Install git

```
sudo apt-get install git
```

## Integration Project

### Download The Project

Clone the intergration project with the following command:

```
git clone https://git.onap.org/integration
```

**Hint:** More information could be found under `integration\bootstrap\vagrant-onap\README.md`

### Configure Deployment Mode

There is an **settings.yaml.development** under `integration\bootstrap\vagrant-onap\etc` (deprecated - `/etc` directory has been moved to project `integration/devtool`) used for different deployment scenarios.

The goal is to have a running SDN-C environment, so in the configuration, it turns off clone and build project. Only file name called **settings.yaml** will be picked-up by the deployment script.

Run the following command to create `settings.yaml` file from the repo's `settings.yaml.development` file:

```
cp settings.yaml.test settings.yaml
vim settings.yaml
```

Here's the example of the outcoming `settings.yaml` file:

```
build_image: "False"
clone_repo: "False"
compile_repo: "False"
enable_oparent: "False"
skip_get_images: "False"
skip_install: "False"
```

#### Hint:

- Under `integration\bootstrap\vagrant-onap\doc\source\features\configure_execution.rst`, it talks about the functionality of these attributes.
- Under `integration\bootstrap\vagrant-onap\doc\source\features\example_usage.rst`, it talks about the use cases of using this tool.

## Modify Vagrantfile

`vim integration/bootstrap/vagrant-onap/Vagrantfile`

- In `configuration = {...}`, find `docker_version` and update the corresponding value to 'latest'
- If you are using VirtualBox provider and have an issue with the VM vagrant creates not resolving hostnames then enable the `natdnshostresolver1`

Here is the diff that worked at the time of writing this.

```
diff --git a/bootstrap/vagrant-onap/Vagrantfile b/bootstrap/vagrant-onap/Vagrantfile
index 0664e5f..667d3bf 100644

Also

## Modify the SDN-C Deployment Script

The **get\_sdnc\_images** function in the "integration/bootstrap/vagrant-onap/lib/sdnc" may need to be synchronized with the images defined in the docker compose file [\[sdnc/oam.git\] / installation / src / main / yml / docker-compose.yml](#). If these are not synchronized you will get a

```
pull access denied for [image name], repository does not exist or may require 'docker login'
```

In addition to the synchronizing the images the keyword **openecomp** has changed to **onap**.

Here is the diff that worked at the time of writing this.

```
diff --git a/bootstrap/vagrant-onap/lib/sdnc b/bootstrap/vagrant-onap/lib/sdnc

## Deployment

### Start Deployment

```
cd integration/bootstrap/vagrant-onap
./tools/run.sh sdnc
```

This will configure and start the guest VM

configure and start the sdnc docker resources on the guest VM.

and finally the SDNC will start

Base OS	Guess OS	dockercontainer
PortForwarding	PortForwarding	onap/sdnc-image:latest
BaseOS -> GuessOS	GuessOS -> onap/sdnc-image:latest	otherdockercontainers
8201 -> 8201	8201 -> 8101	
8282 -> 8282	8282 -> 8181	

#### wait

Once the vagrant has completed running it will still take some time for SDNC to come up. Have patience.

## Connecting to your deployment

### Basic Usage of Vagrant

Vagrant commands are executed on the Base OS.

#### Get Detail about the vagrant Commands

Print the usage use the '-h' option

```
vagrant -h
vagrant <command> -h
```

#### check running vm instances

From the Base OS use the following command to see the running guest VM id and name.

```
vagrant global-status
```

#### Port Forwarding

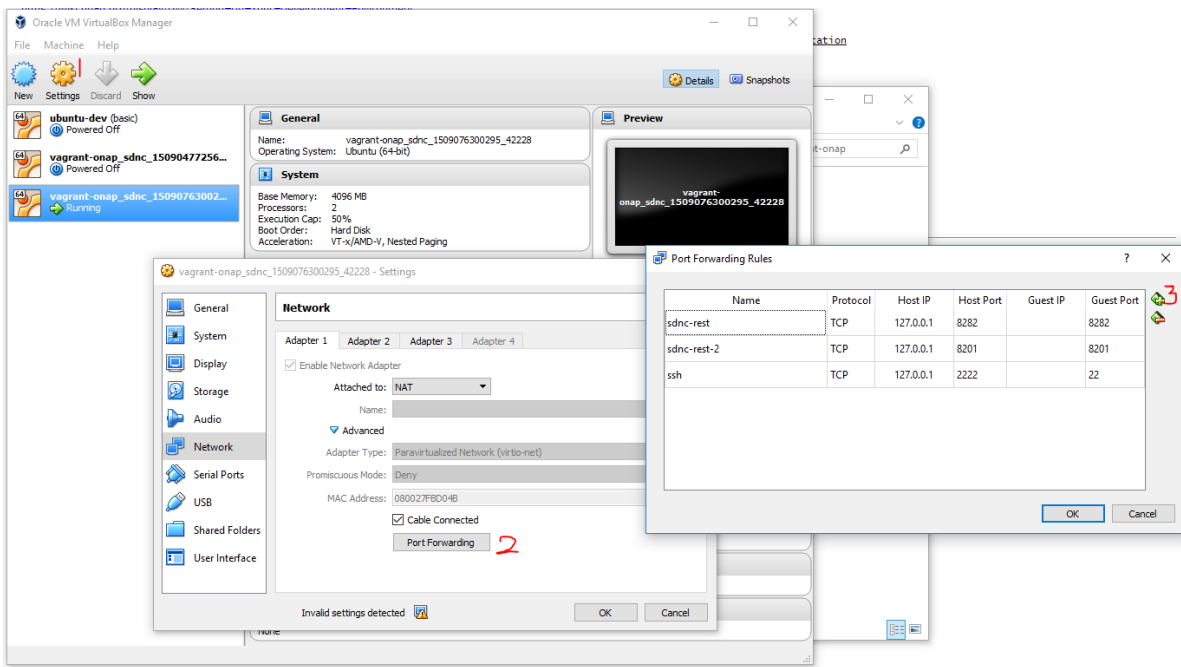

The guest VM is running in its own private network and is using the NAT to get the the Base OS network. To see the port forwarding run the following command.

```
vagrant port sdnc
```

If you don't see any ports Oops. Configuring port-forwarding should have been configured earlier when editing the [\[integration.git\] / bootstrap / vagrant-onap / Vagrantfile](#). Something must of went wrong. Here is the example of a snippet that can be added to the Vagrant file.

```
Vagrant.configure("2") do |config|
  if provider == :virtualbox && "sdnc".eql?(requested_machine)
    config.vm.network "forwarded_port", guest: 8282, host: 8282, protocol: "tcp", auto_correct:
    true
    config.vm.network "forwarded_port", guest: 8281, host: 8202, protocol: "tcp", auto_correct:
    true
  end
end
```

Port forwarding can also be configured in the Virtual Box Gui. Here is an example

ssh to the Guest OS

The follow command will open a ssh terminal to the running guess vm. The guest vm name or id can be used.

```
vagrant ssh sdnc
```

## Basic Usage of Docker

docker commands are executed on the guest OS

Get Detail about the dockerCommands

Print the usage use the '-h' option

```
vagrant -h
```

```
vagrant <command> -h
```

List docker container images

On the Guess VM execute the docker commands

```
docker images
```

List the running docker containers

The following command will list the running docker containers. The container's id, name and which ports are forwarded to the Guess OS can be found in this list.

```
docker ps -a
```

open a terminal to a docker running docker container

Use the docker container id or name use the following command to open a terminal to that container.

```
docker exec -i -t sdnc_controller_container bash
```

## OpenDaylight RestConf API Web GUI

To connect to the running sdnc port forwarding must be configured correctly. The port forwarded in the instruction above was 8282.

<http://baseoshostip:8282/apidoc/explorer/index.html>

The credentials to connect to the SDNC Web GUI are can be found in the file [\[sdnc/oam.git\] / installation / sdnc / src / main / scripts / startODL.sh](#). Look for the variable ODL\_ADMIN\_PASSWORD

Here is an example

```
Credentials: admin/Kp8bJ4SXszM0WXlhak3eHlcse2gAw84vaoGGmJvUy2U
```

## Deploying New Code (based on the standard ONAP lab setup)

This tutorial talks about one way to deploy new sdnc code into the corresponding docker image which is based on the previous chapter "Deploying a Minimal ONAP SDN-C Environment"

### Example: Deploy feature.zip File into Docker Image

The example is about adding a new rpc in the generic-resource-api which is a sub-module of northbound project.

#### Download Project

Download sdnc-northbound project and put it under integration/boostrap/vagrant-onap/opt/openecomp/sdnc

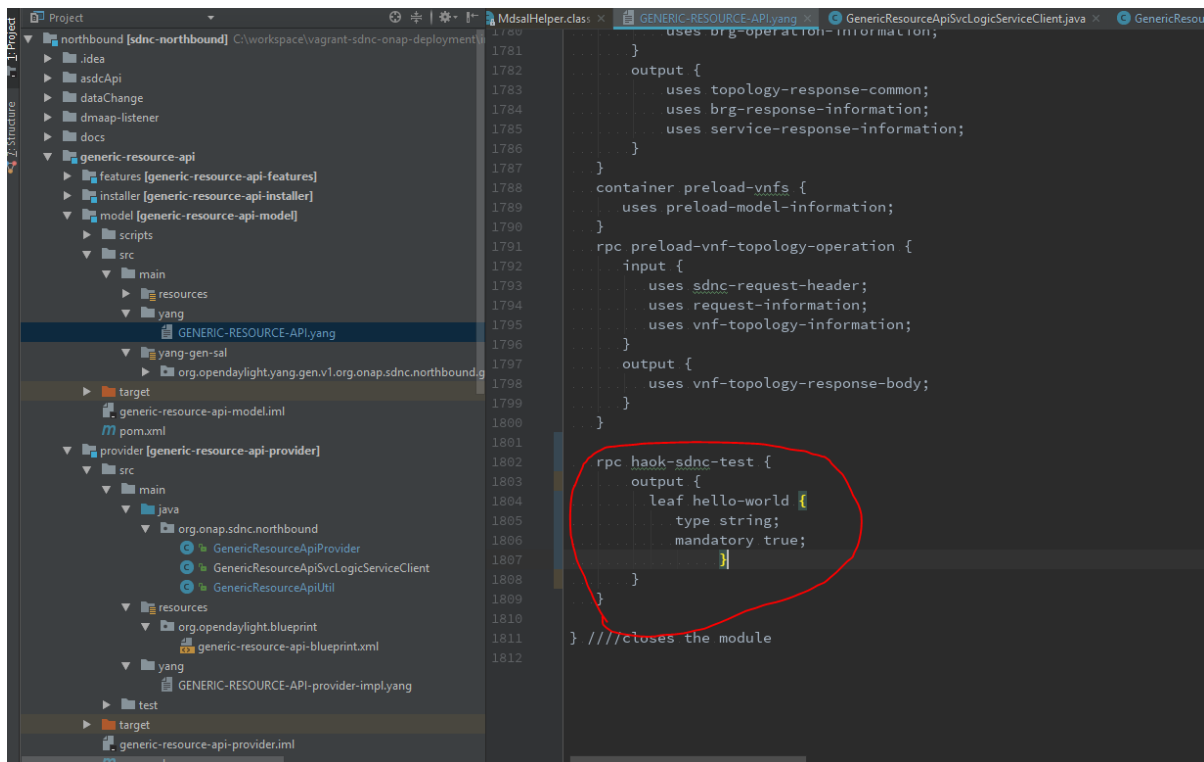

This step is not necessary which is used to align with the folder path where ONAP-integration clone, compile project.

#### Add a New RPC

Edit northinbound/generic-resources-api/model/src/main/yang/GENERIC-RESOURCES-API.yang

For example

```
...
rpc haok-sdnc-test {
  output {
    leaf hello-world {
      type string;
      mandatory true;
    }
  }
}
...
```

## Use Maven to Build Project

build generic-resources-api/model

## Write a Simple Implementation

Implement the new rpc generated by YANG model in GenericResourcesApiProvider

For example

```

@Override public Future<RpcResult<HaokSdncTestOutput>> haokSdncTest() {
    HaokSdncTestOutputBuilder responseBuilder = new HaokSdncTestOutputBuilder();
    responseBuilder.setHelloWorld("hello-world3");
    RpcResult<HaokSdncTestOutput> rpcResult =
        RpcResultBuilder.<HaokSdncTestOutput>status(true).withResult(responseBuilder.build()).build();
    return Futures.immediateFuture(rpcResult);
}

```

## Copy and unzip feature

```
vagrant ssh $(vagrant global-status | grep sdnc | awk '{print $1}')
```

```
docker cp /opt/openecomp/sdnc/northbound/generic-resource-api/installer/target/sdnc-generic-resource-api-1.2.0-SNAPSHOT-installer.zip $(docker ps -a | grep "/sdnc-image" | awk '{print $1}'):/opt/sdnc/features
```

```
docker exec -it $(docker ps -a | grep "/sdnc-image" | awk '{print $1}') bash
```

```
cd /opt/sdnc/features
```

```
unzip -o sdnc-generic-resource-api-1.2.0-SNAPSHOT-installer.zip
```

```
unzip -o -d /opt/opendaylight/current sdnc-generic-resource-api/sdnc-generic-resource-api-1.2.0-SNAPSHOT.zip
```

```
rm sdnc-generic-resource-api-1.2.0-SNAPSHOT-installer.zip
```

```
rm -rf sdnc-generic-resource-api
```

## Re-install Feature

```
/opt/opendaylight/current/bin/client -u karaf feature:uninstall sdnc-generic-resource-api
```

```
/opt/opendaylight/current/bin/client -u karaf feature:repo-remove mvn:org.onap.sdnc.northbound/generic-resource-api-features/1.2.0-SNAPSHOT/xml/features
```

```
/opt/opendaylight/current/bin/client -u karaf feature:repo-add mvn:org.onap.sdnc.northbound/generic-resource-api-features/1.2.0-SNAPSHOT/xml/features
```

```
/opt/opendaylight/current/bin/client -u karaf feature:install sdnc-generic-resource-api
```

```
docker restart $(docker ps -a | grep "/sdnc-image" | awk '{print $1}')
```

Hint: The version 1.2.0-SNAPSHOT could be updated in the future. Please update the version according to the current project version.

Here is an simple sdnc-docker-auto-deploy script if you would like to use.

Download Link: [sdnc-docker-auto-deploy.zip](#)

After download this link, **unzip** the file under integration//vagrant-onap/opt.

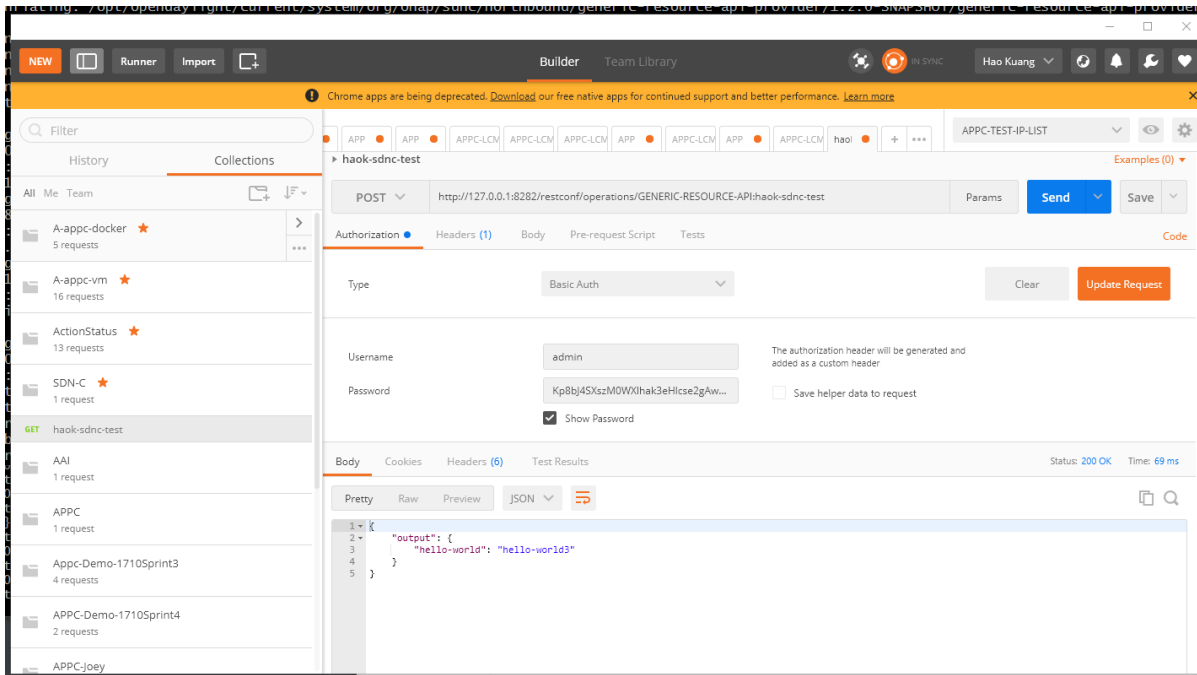

Use **Vagrant ssh** to connect your running sdnc vm.

and find the script, run **./sdnc-docker-auto-deploy.cfg**.

The corresponding configuration is in **sdnc-docker-auto-delpoy.cfg**.

## Verify new rpc

It takes a minute to restart the karaf platform which really depends on the performance of your host machine.

## Remote Debugging

This is the tutorial about how to turn on the remote debug for sdnc docker instance.

### SSH to VM

```
vagrant ssh ${vm-id}
```

### Pre-setup

```
export MTU=$(/sbin/ifconfig | grep MTU | sed 's/.*MTU:/' | sed 's/ .*//' | sort -n | head -1)
```

```
alias docker-compose=/opt/docker/docker-compose
```

```
docker rm ${sdnc-docker-instance-id}
```

```
//check the java process to make sure it's been killed, if not run "sudo kill -9 ${PID}"
```

```
ps aux | grep java
```

### Update docker-compose yaml.file

```
vim /opt/openecomp/sdnc/oam/installation/src/main/yaml/docker-compose.yaml
```

Under sdnc service, add **"5005:5005"** under ports

Under sdnc service, add **"KARAF\_DEBUG=true"** under environment.

Below shows the example
