

HPA Impact on the AAI Project

Background

In R1 (Amsterdam), AAI was used to persist HPA capabilities discovered via the Multi-VIM layer. The information was stored as a string of comma separated attributes.

Assumptions & Decisions

	Assumption/Decision	
1	HPA capabilities, discovered through the Multi-VIM layer, will continue to be persisted in the AAI database.	
2	The information persisted will be extended to include to include hardware vendor platform information.	
3	The format of persisted information is expected to follow the format defined on the HPA Requirement & Capability Specification page.	
4	The format of persisted information is expected to evolve as we move into design activities.
