

K8S / helm basic commands for ONAP integration

Frankfurt Notes

In addition to the mechanisms from El Alto for deploy/undeply the standard helm commands also work. For example in the case to upgrade a specific component like AAI without having to do a helm delete/helm deploy you can use the following:

Example with aai charts

Precondition:

helm deploy has previously been run with override files on the command line so that the .helm/plugins/deploy/cache has been populated

git clone aai to an aai_oom directory since it is a recursive submodule of oom and upgrade using these newly cloned charts

Helm command:

```
helm upgrade -i onap-aai ./aai_oom --namespace onap --timeout 900 -f ${HOME}/.helm/plugins/deploy/cache/onap/global-overrides.yaml -f ${HOME}/.helm/plugins/deploy/cache/onap-subcharts/aai/subchart-overrides.yaml
```

El Alto Notes with new Deploy/Undeploy plugin from OOM Team

```
helm deploy dev local/onap -f /root/integration-override.yaml --namespace onap
```

For slower cloud environment use this to use longer interval for readiness

```
helm deploy dev local/onap -f /root/oom/kubernetes/onap/resources/environments/public-cloud.yaml -f /root/integration-override.yaml --namespace onap
```

Example per prodject with SO:

```
helm deploy dev-so local/onap -f /root/oom/kubernetes/onap/resources/environments/public-cloud.yaml -f /root/integration-override.yaml --namespace onap --verbose
```

If you are using the SNAPSHOT image override file:

```
helm deploy dev-sdnc local/onap -f /root/oom/kubernetes/onap/resources/environments/public-cloud.yaml -f /root/integration-override.yaml -f /root/integration/deployment/heat/onap-rke/staging-image-override.yaml --namespace onap --verbose
```

1. After editing a chart
 - a. cd /root/oom/kubernetes
 - b. make project
 - i. note that for cds/sdnc you need to do make cds; make sdnc
 - c. make onap
2. helm del project --purge
 - a. helm list -a to confirm its gone
 - b. also check pvc's for applications like sdnc/appc and kubectl -n onap delete pvc any remaining ones
 - i. kubectl -n onap get pv | grep project
 - ii. kubectl -n onap get pvc | grep project
 - iii. ...
 - iv. "delete /dockerdata-nfs/dev-project"
 - c. Cleanup shared cassandra (aai, sdc) and shared mariadb (sdnc, so)
 - d. /root/integration/deployment/heat/onap-rke/cleanup.sh project(without dev-)
 - i. example: ./cleanup.sh sdc
 - ii. this script cleans up the shared cassandra and mariadb as well as pvc, pv, jobs etc.
 - iii. if you get an error when doing aai or sdc check to make sure cassandra cleaned up correctly. We have known problem where the cluster does not let schema's to be replicated and you get a Timeout back to cleanup.sh
3. Rebuild helm charts as necessary
 - a. cd /root/oom/kubernetes
 - b. make project
 - c. make onap
4. helm deploy dev local/onap -f /root/oom/kubernetes/onap/resources/environments/public-cloud.yaml -f /root/integration-override.yaml --namespace onap --verbose
5. list pods and ports (with k8 host)
 - a. kubectl -n onap get pods -o=wide
 - b. kubectl -n onap get services
6. Find out why pod is stuck in initializing or crash loopback
 - a. kubectl -n onap describe pod dev-blah-blah-blah

b. `kubectl -n onap logs dev-blah-blah-blah`

complete removal steps (same as Beijing)

Faster method to do a delete for reinstall

`kubectl delete namespace onap`

`kubectl delete pods -n onap --all`

`kubectl delete secrets -n onap --all`

`kubectl delete persistentvolumes -n onap --all`

~~`kubectl -n onap delete clusterrolebindings --all`~~

`helm del --purge dev`

`helm list -a`

`helm del --purge dev-[project]` use this if `helm list -a` shows lingering releases in DELETED state

if you have pods stuck terminating for a long time

`kubectl delete pod --grace-period=0 --force --namespace onap --all`

CDS Specific Notes (**Dublin**) - In Dublin release, the CDS charts are added as a subchart in OOM. However, the deployment of CDS charts is achieved as part of the SDN-C deployment in Dublin release. Thus, if any changes required to be made in the CDS chart the following steps taking: "make cds; make sdnc ; make onap"

| Merge "Tune OpenDaylight parameters" | | | |
|--|------|-----------|--|
| [oom.git] / kubernetes / | | | |
| drwxr-xr-x | .. | | |
| -rw-r--r-- | 902 | LICENSE | blob history raw |

| drwxr-xr-x | - | aaf | tree history |
| m----- | - | aai | history |
| drwxr-xr-x | - | appc | tree history |
| drwxr-xr-x | - | cds | tree history |
| drwxr-xr-x | - | clamp | tree history |
| drwxr-xr-x | - | cli | tree history |
| drwxr-xr-x | - | common | tree history |
| drwxr-xr-x | - | config | tree history |

SDNC Values.yaml chart in OOM

104 # dependency / sub-chart configuration

105 cds:

106 enabled: true

Beijing Notes

```
kubectl config get-contexts
```

```
helm list
```

```
root@k8s:~# helm list
```

| NAME | REVISION | UPDATED | STATUS | CHART | NAMESPACE |
|------|----------|--------------------------|----------|------------|-----------|
| dev | 2 | Mon Apr 16 23:01:06 2018 | FAILED | onap-2.0.0 | onap |
| dev | 9 | Tue Apr 17 12:59:25 2018 | DEPLOYED | onap-2.0.0 | onap |

```
helm repo list
```

```
NAME URL
```

```
stable https://kubernetes-charts.storage.googleapis.com
```

```
local http://127.0.0.1:8879
```

```
#helm upgrade -i dev local/onap --namespace onap -f onap/resources/environments/integration.yaml
```

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml
```

```
# to upgrade robot
```

```
# a config upgrade should use the local/onap syntax to let K8 decide based on the parent chart (local/onap)
```

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml
```

```
# if docker container changes use the enable:false/true
```

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml --set robot.enabled=false
```

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml --set robot.enabled=true
```

```
# if both the config and the docker container changes use the enable:false, do the make component, make onap then enable:true
```

```
helm upgrade -i dev local/onap --namespace onap -f /root/integration-override.yaml --set robot.enabled=false
```

Confirm the assets are removed with get pods , get pv, get pvc, get secret, get configmap for those pieces you dont want to preserve

```
cd /root/oom/kubernetes
```

```
make robot
```

```
make onap
```

```
helm upgrade -i dev local/onap --namespace onap -f /root/integration-override.yaml --set robot.enabled=true
```

```
kubectl get pods --all-namespaces -o=wide
```

```
# to check status of a pod like robots pod
```

```
kubectl -n onap describe pod dev-robot-5cfddf87fb-65zvv
```

```
pullPolicy: Always IfNotPresent option to allow us to
```

```
### Faster method to do a delete for reinstall
```

```
kubectl delete namespace onap
```

```
kubectl delete pods -n onap --all
```

```
kubectl delete secrets -n onap --all
```

```
kubectl delete persistentvolumes -n onap --all
```

```
kubectl -n onap delete clusterrolebindings --all
```

```
helm del --purge dev
```

```
helm list -a
```

```
helm del --purge dev-[project] use this if helm list -a shows lingering releases in DELETED state
```

if you have pods stuck terminating for a long time

```
kubectl delete pod --grace-period=0 --force --namespace onap --all
```

of NAME=dev release

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml
```

To test with a smaller ConfigMap try to disable some things like:

```
helm upgrade -i dev local/onap --namespace onap -f /root/integration-override.yaml --set log.enabled=false --set clamp.enabled=false --set pomba.enabled=false --set vnfsdk.enabled=false
```

(aaf is needed by alot of modules in Casablanca but this is a near equivalent)

```
helm upgrade -i dev local/onap --namespace onap -f /root/integration-override.yaml --set log.enabled=false --set aaf.enabled=false --set pomba.enabled=false --set vnfsdk.enabled=false
```

Note: setting log.enabled=false means that you will need to hunt down /var/log/onap logs on each docker container - instead of using the kibana search on the ELK stack deployed to port 30253 that consolidates all onap logs

Slower method to delete full deploy

```
helm del dev --purge
```

```
kubectl get pods --all-namespaces -o=wide
```

look for all Terminating to be gone and wait till they are

```
kubectl -n onap get pvc
```

look for persistant volumes that have not been removed.

```
kubectl -n onap delete pvc dev-sdnc-db-data-dev-sdnc-db-0
```

dev-sdnc is the name from the left of the get pvc command

same for pv (persistant volumes)

```
kubectl -n onap get pv
```

```
kubectl -n onap delete pv pvc-c0180abd-4251-11e8-b07c-02ee3a27e357
```

#same for pv, pvc, secret, configmap, services

```
kubectl get pods --all-namespaces -o=wide
```

```
kubectl delete pod dev-sms-857f6dbd87-6lh9k -n onap (stuck terminating pod )
```

full install

of NAME=dev instane

```
helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml
```

update vm_properties.py

```
# robot/resources/config/eteshare/vm_properties.py
```

```
# cd to oom/kubernetes
```

Remember: Do the enabled=false BEFORE doing the make onap so that the kubectl processing will use the old chart to delete the POD

```
#
```

```
# helm upgrade -i dev local/onap --namespace onap -f integration-override.yaml - this would just redeploy robot  
becuase its configMap only
```

Container debugging commands

```
kubectl -n onap logs pod/dev-sdnc-0 -c sdnc
```
