

R4 API Document

DistributeTrafficCheck

This command runs a VNF check (post- or pre-check) for distribute traffic specifically and returns the result.

Target URL	/restconf/operations/appc-provider-lcm:distribute-traffic-check
Action	DistributeTrafficCheck
Action-Identifiers	Vnf-id
Payload Parameters	See below
Revision History	Unchanged in this release

Request Payload Parameters:

Parameter	Description	Required?	Example
configuration-parameters	A set of instance specific configuration parameters should be specified. If provided, APP-C replaces variables in the configuration template with the values supplied. The parameters are associated with request template defined with CDT	Yes	"payload": "{\"configuration-parameters\":{\"distribution_config_file\":\"/opt/onap/ccsdk/Playbooks/dt-vpkg-1-config.json\", \"distribution_config_file_content\":\"...\", \"playbook\":\"ansible_vfw_distributetraffic@0.00.yml\", \"node_list\": \"[vfw-1]\", \"is_post_check\": True}}"

Exemplary CDT template for Ansible protocol:

```
{  
    "PlaybookName": ${playbook},  
    "NodeList": ${node_list},  
    "EnvParameters": {  
        "IsPostCheck": ${is_post_check},  
        "ConfigFileName": ${distribution_config_file}  
    },  
    "FileParameters": {  
        ${distribution_config_file} : ${distribution_config_file_content}  
    },  
    "Timeout": 3600  
}
```

EnvParameters includes protocol specific parameters for Ansible playbook or Chef cookbook. Here with information if the Check is performed before or after traffic distribution (IsPostCheck) and with further information about the distribution that will be performed (PreCheck) or for the one that was already performed (PostCheck). EnvParameters has two mandatory parameters: "IsPostCheck" and the second one that folds information about name of file with configuration of traffic distribution. FileParameters section specifies content of file that will be uploaded to Ansible server, the file will be loaded by playbook as Input parameters. This file holds information provided by the OOF in DistributeTraffic optimization Response: [Traffic Distribution](#)

DistributeTrafficCheck Response

The response does not include any payload parameters.

Success: A successful distribute check returns a success status code 400 when pre- or post- check conditions are satisfied

Success: A successful distribute check returns a success status code 401 when pre- or post- check conditions are not satisfied
