

Building Entire ONAP

- [Warnings](#)
- [Pending requests](#)
- [Procedure using git-repo](#)
- [Procedure - deprecated](#)
 - [Clone/pull all repos sh script](#)
 - [Root pom.xml](#)
 - [Known Issues in progress](#)
 - [Snapshots](#)
 - [20171227](#)
 - [Links](#)

You can build most of the projects directly in IntelliJ - but everything can be built using a [root pom.xml](#) example (docker is required for dcae-inventory). Ideally we would all run a standardized vagrant development environment (running the same versions of grunt/node/npm/bower, jdk etc).

Setup your environment first (OSX, RHEL, Ubuntu or Windows) - [Setting Up Your Development Environment](#)

The git checkout script has been updated to reflect all the repos (minus the deprecated dcae and mso) in ONAP as of 20170831 - <https://github.com/obrienlabs/onap-root>

[Building Entire ONAP](#)

Procedure using git-repo

(Thanks [David Bainbridge](#))

<https://gerrit.googlesource.com/git-repo>

git clone <https://gerrit.googlesource.com/git-repo>

see <https://source.android.com/setup/downloading>

Updated pom.xml with the latest master changes for 20171227 <https://github.com/obrienlabs/onap-root/blob/master/pom.xml>

curl <https://jira.onap.org/secure/attachment/10828/pom.xml> > pom.xml

Only issue is you will need to copy the License.txt before you run for aai - still verifying the fix for

AAI-568 - Getting issue details... **STATUS**

```

mkdir ~/bin
PATH=~/bin:$PATH
curl https://storage.googleapis.com/git-repo-downloads/repo > ~/bin/repo
chmod a+x ~/bin/repo
mkdir onap
cd onap
# currently updating my own with no dcae, mso, aai-service - they are deprecated
#repo init -u https://github.com/obrienlabs/onap-root/tree/master/onap-manifest
repo init -u https://github.com/dbainbri-ciena/onap-manifest
repo sync -q --no-clone-bundle
# pull https://github.com/obrienlabs/onap-root/blob/master/pom.xml
curl https://jira.onap.org/secure/attachment/10828/pom.xml > pom.xml
cp aai/logging-service/License.txt .
mvn clean install -U -DskipTests=true -Dmaven.test.skip=true -Dmaven.javadoc.skip=true

```

```

Procedure - deprecated

- create a root directory like "onap"
 - copy the sh script there
 - run the sh script
 - notice the directory structure with embedded repos
 - copy the root pom.xml
 - maven build with the root pom
 - there will be a couple projects that may not build due to your settings.xml repos, the state of a couple of the projects, whether you have docker running - see the developer pages to make sure you are setup
- [ONAP Developer Checklist](#)
[Setting Up Your Development Environment](#)

Clone/pull all repos sh script

This script serves 3 purposes

- 1) ssh clone all ONAP repos (those of us with unrestricted internet access)
- 2) https clone all the ONAP repos (for those behind a firewall)
- 3) pull all repos - refreshing them in a close to an atomic pull as possible.
- 4) we currently cannot use an automated script around the following because a 1.0/1.1 filter/metadata is missing - also the directory structure differs for repos (some have a root repo, others are parent-less peers)

<https://gerrit.onap.org/r/projects/?format=text>

Use:

pass in the command clone|pull and your onap gerrit id (note oam repo is the largest at 0.8Gb transferred at 6Mb/sec)

```
./git_recurse.sh clone <your_gerrit_username>
```

clone by https for those behind a firewall

```
./git_recurse.sh clone_https michaelobrien uHaBPMvR47mocSbB3YnK56EB1RR3Keer6vatj5555555555
```

to refresh project within a 5 min window

TODO: checkout branch and merge master into branch

Todo: move to private branch or JIRA to be under source control -

[COMMON-18](#) - Getting issue details...

STATUS

For now on <https://github.com/obrienlabs/onap-root>

Root pom.xml

version 1.1.2-SNAPSHOT

Place this pom.xml at the root of where you ran the [git_recurse.sh](#) (on top of all the repos) - it expects the same directory structure as setup in gerrit.

This is a root reactor pom.xml that can be used to build all or parts of onap

Some repos like dcae-inventory will require [docker installed](#) to build the images.

for speed build with all 5 repos in (~.m2/settings.xml) and the maven options below (no tests and no test compilation) - and try to get a 8-12 thread machine and most importantly a fast SSD - or use a Mac.

```
obrienbiometrics:core michaelobrien$ mvn clean install -U -DskipTests=true -Dmaven.test.skip=true -Dmaven.javadoc.skip=true -Dadditionalparam=-Xdoclint:none
```

<https://github.com/obrienlabs/onap-root>

Known Issues in progress

Last run 20170614

Try to develop in OSX - it has the least issues when building ONAP in its entirety.

There are issues with some of the projects (primarily in windows - like DCAE attempting to reinstall npn) - these may be due to the fact I am still ramping up on ONAP and have not done a full in-depth review of each project. Where available I have commented on the reason why a particular project is failing its local build (all should build fine in CI). Some compile issues were recently fixed since May 12th when I started building ONAP.

Some builds are only meant for deployment (a result of using mvn install) like appc - you may want to comment this one unless you are modifying it (run off artifacts).

```
replace /Users/michaelobrien/wse_onap/onap7/appc/deployment/installation/appc/target/docker-stage/opt/openecomp/appc/svclogic/graphs/appc/graph.versions? [y]es, [n]o, [A]ll, [N]one, [r]ename: error: invalid response [{ENTER}]
```
