MSB (Micro Service Bus):

1 High Level Component Definition and Architectural Relationships

Istanbul-R9

The Microservice Bus function provides service registration, discovery and communication services for microservices as well as a gateway for internal & External communication for the services:

- Register communication services
- Discover communication services
- Manage communication between microservices

OOM connects to MSB to register and update service information when it instantiates service endpoints.

MSB and DMaaP are complementary. MSB provides the restful API service registration/discovery/routing/API gateway, which addresses the sync/rpc communication pattern in microservice architecture, in contrast, DMaaP provides messages/file transfer, which mainly focused on the async communication pattern in microservices architecture.

2. API definitions

2.1 MSB provides the following interfaces:

These are separate interfaces.

Interface Name	Interface Definition	Interface Capabilities	API Spec (Swagger)
MSBE-1	Registration and Discovery interface	The registration and discovery interface provides the following capabilities: <ul style="list-style-type: none">• Register/Unregister a service• Discover a service	Microservice Bus API Documentation#RegisterservicetotheMicroserviceBus
MSBE-2	Service Request Interfaces	Provides the capability to deliver and receive a service request and subsequent communication.]	MSB API gateway acts as a proxy between the client and the server, the client just sends the request to MSB API gateway IP+Port, MSB handles the service discovery and reliable communication with the backend service including load balancing, retries, circuit breaker, etc.
MSBE-3	MSB Admin Interface	Provides the ability to administer policy and routing for the service requests.	It's a management UI for viewing or modifying registered services, you can find it at HTTPS://MSB_API_AGATEWAY_IP:80 on your running MSB instance.

Note: xxxl interface is a Component internal interface. xxxxE interface is a component external interface

The current API documents can be found at:

- [Microservice Bus API Documentation](#)

2.2 MSB consumes the following Interfaces:

Interface Name	Purpose Reason For Use	API Spec (Swagger)
N/A	N/A	

3. Component Description:

A more detailed figure and description of the component

<https://docs.onap.org/projects/onap-msb-apigateway/en/latest/index.html#master-index>

<https://docs.onap.org/projects/onap-msb-apigateway/en/latest/platform/architecture.html>

4. known system limitations

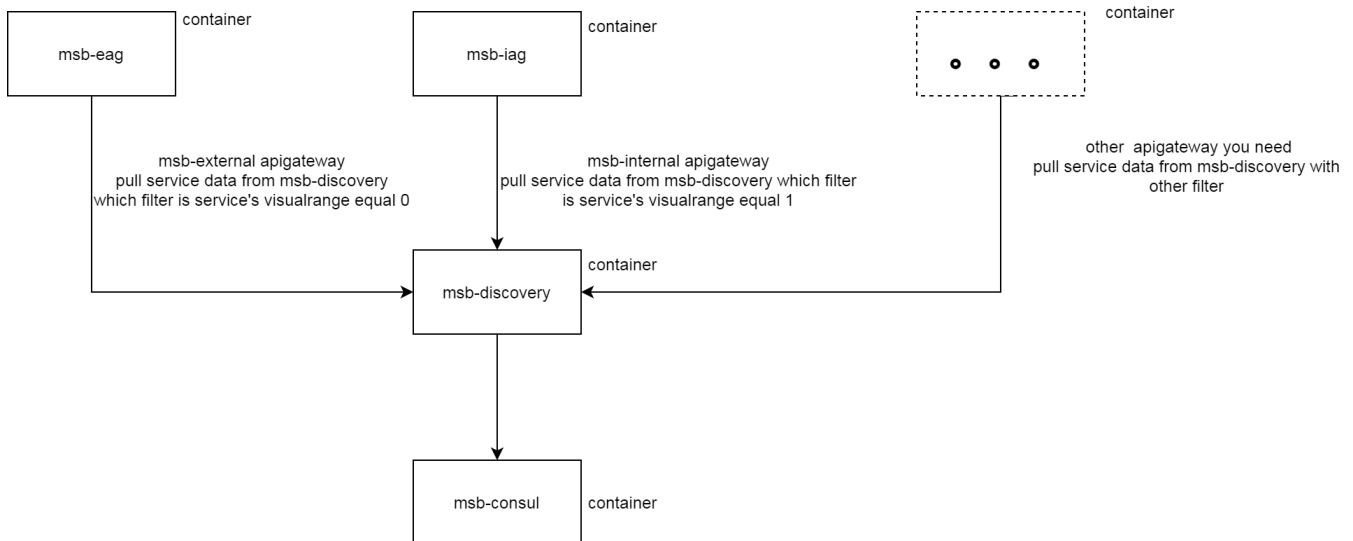

MSB API gateway has been performance tested in this scenario:

- Client(wrk) --> MSB API gateway --> Test service(Nginx)
- Test machine (client, msb and test service): 8 cpu Core, 8G memory
- Network 10000M

The test result is 50000 request per second.

5. System Deployment Architecture

MSB consists of X containers:

<https://docs.onap.org/projects/onap-msb-apigateway/en/latest/platform/installation.html>

6. New Capabilities in this Release

This release, MSB adds the following Capabilities:

- According to Requirement 437 and 438 (see below), all components of MSB have to update the python and java language's version.

⚡ **REQ-437** - COMPLETION OF PYTHON LANGUAGE UPDATE (v2.7 v3.x) **IN PROGRESS**

⚡ **REQ-438** - COMPLETION OF JAVA LANGUAGE UPDATE (v8 v11) **IN PROGRESS**
